This document is applicable to the following part numbers:

- Software Part Number 530-00235-100, Release 8.2.2 or Later
- Hardware Part Number 700-00030-()

System Configuration

When contacting your dealer or Avidyne technical support, and when logging onto MyAvidyne.com for the first time, please have your EX5000C serial number available:

Entegra EX5000 S/N: ________________________________

About this Guide

This guide assumes that all available sensors and software options have been installed in your airplane. The page layouts and button descriptions in this guide may differ slightly from what you observe on your EX5000. If your system is configured with a partial set of the available sensors, then some views may differ from this guide.

Note: All images contained within this document, including screenshots and other displays, are for reference use only and are subject to change. The images contained herein may differ slightly from your actual equipment or display.
Notes and Warnings

Notes and warnings provide guidance for the use of the EX5000. Avidyne strongly suggests that you pay close attention to notes and warnings for your own safety. For example:

**Note**: Notes provide useful information about how to use the EX5000.

![Warning Symbol] Warnings are prefaced with exclamation points and denote information that can prevent serious injury or death on the part of the user.

The instructions and warnings in this manual are not intended to replace the instructions and warnings for other equipment on your aircraft. It is critical that you as the pilot in command have a complete understanding of the warnings, operating instructions, and limitations for all equipment installed on your aircraft.

This manual assumes that the reader is an appropriately licensed pilot. Avidyne strongly recommends that you use the EX5000 only under VFR conditions until you are very familiar with the EX5000.

If you have questions, please contact Avidyne at 800-284-3963 (800-AVIDYNE) before operating with the EX5000 under IFR conditions.

Before conducting flight operations, be sure to verify that time and date settings on the System Time Setup page are correct and in GMT (UTC). It is critical that the time be set to GMT to provide accurate display of Datalink weather. See Section 10.1, "Aux Main Page" on page 89 for more information.

When using the EX5000, be sure to cross-check the data displayed against other data sources for accuracy including other flight deck instruments and charts.
The displayed terrain and obstacle indicators are only advisory. Do not rely on the EX5000 as the sole source of obstacle and terrain avoidance information. Always refer to current aeronautical charts for appropriate terrain and obstacle information.

The EX5000 is not intended to replace your navigation charts or primary navigation aids. Use the EX5000 as a supplement to other navigation sources, to enhance your overall situational awareness. Do not rely on the navigation data in your EX5000 as your sole reference for navigation.

While a properly updated database contains the latest official information available, the manufacturers will not be held responsible for any inaccuracy or omissions therein. *Never* use the terrain displayed on the EX5000 as the only reference for terrain avoidance.

The transmission of datalink weather information means there is some delay from real time until the weather information is displayed on the EX5000. Therefore, use datalink weather information only for strategic route planning. Avoid severe weather areas with a safe margin of distance. Do not use the EX5000 to penetrate severe weather, thunderstorms, cells or lines of cells.

By using Broadcast datalink, you can access weather information made available from sources external to Avidyne Corporation. Avidyne does not control, edit or review the content of such information and is not responsible for such information or the actions or conduct of any company that provides sources of weather data through the Broadcast datalink. Therefore, **ALL WEATHER DATA IS PROVIDED AS-IS** and neither Avidyne nor its suppliers, subcontractors, or developers (collectively called “Suppliers”) are responsible for: 1) the accuracy, completeness, timeliness, reliability, content, or availability of the weather data or any other datalink information accessed; 2) loss or damage to your records or data; or 3) your use of, or results achieved from, the weather data or any other information accessed.
Notice regarding NOTAM information

NOTAM information is subject to constant change and it is extremely important that all pilots check with Flight Service for applicable NOTAMs prior to EVERY flight. Call 1-800-WXBRIEF (992-7433) for the latest information.

The NOTAM information provided by the EX5000 is for planning purposes only. Always consult official NOTAMS for the latest restrictions.

Avidyne does not provide a complete list of NOTAMS. Local NOTAMS, most laser light NOTAMS, and any NOTAMS other than restricted airspace are not listed.

By using the Avidyne Services you are able to access information made available from a variety of sources. Avidyne does not control, edit or review the content of such information and is not responsible for such information or the actions or conduct of any company that provides sources of weather data procured by Avidyne.

1 Introduction

The Entegra EX5000 Multi-Function Display (MFD) provides a moving map view of your flight plan, broadcast datalink weather, lightning, traffic, navigation data, obstacles, terrain, and CMax™ approach plates with an intuitive user interface. The EX5000 offers the following standard and optional features:

- Engine instruments display.
- Normal and Emergency Checklist display.
- Lightning information display from a WX-500 or Avidyne TWX-670 lightning sensor, if installed.
- Full ARINC-429 databus capability, allowing the EX5000 to display curved flight paths, procedure turns, and holding patterns from a compatible GPS navigator.
- Traffic information display from Avidyne TAS600 Series, ADS-B traffic sensors, L-3 Skywatch, or Garmin TIS traffic systems.
- Terminal procedure chart display using the CMax™ function.
- Display of weather and flight restriction information when interfaced with an external Broadcast Datalink receiver including ADS-B FIS-B receivers.
- Display of TAWS terrain information when interfaced with an installed EGPWS system.

**Note:** Consult the Flight Manual Supplement (FMS) provided with the aircraft and/or sensors prior to operation. The FMS contains information specific to your installation and may contain operating limitations applicable to your aircraft configuration.
1.1 Using the Entegra EX5000 MFD

The controls on the bezel of the Entegra EX5000 are placed to allow you quick and intuitive access to the information you need, when you need it (see Figure 1.1).

![Figure 1.1 Entegra EX5000 MFD](image)

1) **PhotoCell Light Sensor**—Automatically compensates display brightness for varying lighting conditions.

2) **Brightness Control**—Allows you to override the default display brightness and adjust the brightness level. Press the top of the button to brighten the display; press the bottom to dim it.
3) **Data Port**—Provides a front panel access point for loading database updates.

**Note:** When removing the rubber cap from the data port, pull the cap gently **from the top** until it pops out. Make sure the cap is out of the way (but not removed) before plugging anything into the USB port. Do not tug on the tab at the bottom of the cap; this can cause the loss of the protective cap.

4) **Buttons**—Used to select modes or change the display as indicated. Buttons are active when a label appears on the screen adjacent to the key.

5) **Emerg. Checklist**—The *Emerg. Checklist* button is always available to provide quick access to the Emergency Checklists. For more information, see Section 7.4, "Emergency Checklists" on page 53.

6) **Message Bar**—The message bar keeps you informed about critical as well as routine information from the EX5000. When information needs to be conveyed the message bar appears next to the bottom right button.

**Note:** The message bar displays one message at a time. If more than one message is available, the message bar will display the highest priority message first. Press the ACK button to clear the current message and view those underneath.

7) **Page Control knob**—The left knob provides quick access to the main EX5000 pages, including the Map page, Trip page, and Aux page, as well as the main pages for any optional features. The current page is highlighted in the Page Bar on the lower left corner of the screen.

8) **Selection & Range Control knob**—Depending on the page you are viewing, the right knob controls functions such as selecting items on the page or changing the view range. The label on right knob changes as appropriate.
Introduction

1.2 Power Up

On power up, the system performs a brief hardware self-test, then systematically initializes its functions. After the system initializes (about a minute after power-on), the title page, with database currency information, is displayed.

When the EX5000 is ready the message, “Press any bezel key to continue”, is displayed.

![EX5000 Startup Page](image)

The EX5000 Startup page reports the valid dates for the currently loaded CMax™ and NavData. Check to ensure that you do not have any expired databases before continuing.

For CMax data:

- If the issue date for the next update has passed, the Startup page displays “Update Available” in white.
- If the current date is more than a week past the issue of the next update, “Update Required” displays in yellow cautionary text.
- If CMax is more than 10 weeks out of date, access to the charts is revoked until new CMax data is loaded.
For NavData, the date range displays if the data is valid; if it is not valid, the word “EXPIRED” and the expiration data display in yellow.

For more information about updating CMax and NavData, see Section 12.1, "Updating Your Databases" on page 111.

**Note:** When you press a bezel key from the Startup page, either the Initial Fuel page or a series of three Cirrus-defined Safety pages display (For aircraft with Exa, the Initial Fuel page displays first). Read these pages carefully to determine your readiness for flight. Depending on your aircraft’s features, either the Map or Engine page displays after you read and respond to the Safety pages.
Introduction

THIS PAGE INTENTIONALLY LEFT BLANK.
2 Map Page

The Map page displays your current flight plan, overlaying a map of the area over which you are flying. The EX5000 allows you to select the data you want to display on the Map page.

Rotate the Select knob to open the Map page.

This section discusses the following topics:

- Map Page—Controls, page 8
- Map Symbols—Terrain and Position, page 15
- Map Symbols—Runways and Flight Plan, page 19
- Map Orientation Control, page 21
- Errors Displayed on the Map Page, page 21

Note: On startup, you may see three Cirrus-defined Safety pages after the Startup page. Read these pages carefully to determine your readiness for flight. The Map page displays after you respond to the Safety pages.
2.1 Map Page—Controls

Buttons on the left side of the bezel provide access to sensor modes and pages. Buttons on the right side of the bezel access the mapping functions, and control how the Map is viewed.

**Figure 2.1 Map Page Controls**

*Note:* For information about the Map Symbols, see Section 12.5, "Map Symbols" on page 122.

1) **Sensor Functions**—Control overlay and modes of available sensors. Buttons only display for the sensors installed in your aircraft:

- **Traffic**—Cycles through traffic sensor modes. See Chapter 3 "Traffic Mode and the Traffic Page," for more information on traffic modes.

- **Lightning** - Controls the display of lightning strikes or cells (cells for WX-500 only) on the map (when interfaced with an Avidyne TWX670, an L3 WX-500 Stormscope, or a satellite-
weather Broadcast Datalink receiver). For instructions on using the L3 WX-500 Stormscope, see that manufacturer’s documentation. For TWX670 cell information, see the WxOvly key > TWXCELL selection.

Note: (For WX-500 only.) The lightning sensor maps thunderstorm activity by monitoring electrical discharge activity within a 200-mile radius of the aircraft. If the display range is set to less than 25NM, only lightning strikes within 25NM are shown. If the display range is set to greater than 25NM, all lightning strikes are shown.

Only one mode can be displayed on the EX5000 MFD at any time. The EX5000 provides scalable support for a number of different weather sensors so you can use the MFD to get the best view of hazardous weather and options to avoid it.

- **Datalink** - Displays lightning strikes obtained from the Datalink weather service, depending on the weather service and subscription level. Lightning strikes are represented by lightning bolts in white, yellow or dark yellow, depending on the age of the strike.

- **Strike** - Displays lightning strikes obtained from the lightning sensor. Lightning strikes are displayed as follows:
  - WX-500 lightning strikes are displayed as yellow ‘X’s.
  - TWX670 lightning strikes are displayed as ‘X’s. Strike intensity is indicated using 5 colors from red to green-yellow. A strike displayed in red indicates an area of very high intensity, while a strike displayed in green-yellow indicates an area of low-to-moderate intensity.

Note: When strikes are selected to display along with TWX cell data, the strike colors change to white to improve visibility against the colored cells.

- **Cell** - Displays storm cells using cell data obtained from a WX-500 stormscope. Each lightning strike is displayed as a yellow ‘+’ sign, and clumps of strikes indicate the cell and cell intensity.
Map Page

- **Display Off** - Turns display of lightning information off.

- **Clear Strikes**—Removes current lightning symbols to allow for the refresh of lightning data when using a onboard lightning sensor. Does not remove Datalink lightning.

- **WX Rprts**—Controls the type of Datalink weather information displayed on the map, as follows:
  - **All**—Displays graphical METARs, AIRMETs, and SIGMETs.
  - **METARS**—Displays graphical METARs only.
  - **AIRMET**—Displays graphical AIRMETs only.
  - **SIGMET**—Displays graphical SIGMETs only.
  - **DSPLY OFF**—Turns off display of all weather information.

For more information about Datalink functions, see Section 11, "Datalink (Optional)" on page 101.

- **Emerg. Checklist**—Opens the Emergency Checklist page. For more information, see Section 7.4, "Emergency Checklists" on page 53.

2) **Map Functions**—Controls basic look of the map in terms of orientation, number of elements, and base map.

- **View**—Orients the map for either Track/Heading Up or North Up. FORWARD and CENTER views are oriented with Track/Heading Up. North Up orients the map to true North, with the ownship symbol rotated to show track/heading.
  - **Forward** - 120° view with airplane’s present position displayed at the bottom. Current heading (or track) is displayed at the top of the map.
  - **Center** - 360° view with airplane’s present position displayed at the center of the compass range ring with current heading (or track) at the top of map.
  - **North up** - 360° view with airplane’s present position displayed at the center, and north is always at the top of the map.

- **Declutter**—Controls the four levels of navigation database detail on the Map from most to least:
- **Base Map**—Controls the base map layers:
  - **TERRAIN**—Color-contoured terrain, bodies of water, and political boundaries.
  - **BASE**—Bodies of water and Political boundaries
  - **NONE**—No base map

- **Wx Ovly** - Weather Overlay controls the type of weather information displayed on the map. Press Wx Ovly to cycle through the display options:
  - **US, CAN or LOC RDR** - If Broadcast Datalink is installed and available, the single down arrow displays basic Datalink RADAR information on the map. Storm cell movement is not displayed. The external Broadcast Datalink receiver receives a constant stream of weather data for the entire United States via a satellite radio system. US RDR displays CONUS weather. CAN RDR displays Canadian weather. LOC RDR displays regional radar for ADS-B configurations.
  - **US RDR+** - If Broadcast Datalink is installed and available (depending on your Datalink service level), the single down arrow and plus sign displays full Datalink RADAR for CONUS, including storm cells.

For many operations, the EX5000 displays weather data in the same way, regardless of which Datalink system is in use. Both systems provide datalink radar data—a composite image depicting precipitation as seen by multiple ground-based weather radar sites. The image is color-coded to show intensity levels and precipitation types. Broadcast Datalink, however, especially at a
higher service level, provides more data (such as storm cell movement and Datalink lightning).

For Datalink RADAR, small areas of high-intensity datalink radar data might not be displayed on the EX5000 at high range settings. Instead, larger areas of surrounding lower-intensity returns might obstruct indications of severe precipitation at Map ranges higher than 250 nm. Avoid using Map ranges greater than 250 nm when RADAR echoes are shown in the vicinity of the aircraft.

**TWXCELL** - If Wx Ovly is set to TWXCELL, the EX5000 displays thunderstorm cells detected by the TWX670, using colors (Table 2.1) to indicate levels of storm intensity. For example, Figure 2.2 shows an aircraft located at the edge of intense thunderstorm activity. In this instance, the aircraft must be flown away from the thunderstorm. The TWX670 detects and measures lightning strike energy and generates cell data that the EX5000 displays in color. This mode shows dangerous convective areas that you must avoid.

![Figure 2.2 TWXCELL Mode Display](image)

**Note:** If cells appear in the same location as nav aids, obstacles, or TFRs, the cells will cover part or all of the nav aids, obstacles, or TFRs. To more clearly view the nav aids, obstacles, or TFRs, turn off the TWXCELL mode by pressing WxOvly and selecting DSPLY OFF or one of the other options. When desired, you can switch back to CELLMODE to see the storm cells.
The TWX670 sensor outputs hexagons of varying widths from 0.5 NM to 10.0 NM. Occasionally, as the MFD display is zoomed, you may notice that the hexagon size changes abruptly. This is normal as the MFD consistently uses the highest fidelity TWX lightning data available.

Table 2.1 describes the colors displayed by the EX5000.

**Table 2.1 Thunderstorm Activity (Cell) Colors**

<table>
<thead>
<tr>
<th>Color</th>
<th>Interpretation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>Intense thunderstorm activity - presence of hazardous atmospheric conditions is certain.</td>
</tr>
<tr>
<td>Orange</td>
<td>Weather conditions are approaching intense thunderstorm activity.</td>
</tr>
<tr>
<td>Orange-Yellow</td>
<td>Heavy thunderstorm activity - high likelihood of hazardous atmospheric conditions.</td>
</tr>
<tr>
<td>Yellow</td>
<td>Weather conditions are approaching heavy thunderstorm activity.</td>
</tr>
<tr>
<td>Green-Yellow</td>
<td>Moderate thunderstorm activity - severe turbulence and unsettled atmospheric conditions likely.</td>
</tr>
<tr>
<td>Green</td>
<td>Weather conditions are approaching moderate thunderstorm activity.</td>
</tr>
</tbody>
</table>

Color representing less intense thunderstorms does not imply that it is acceptable or safe to fly in those areas. **Always avoid areas of indicated thunderstorm activity, regardless of color displayed.**

The TWX670 detects thunderstorm cell activity up to a 200 nm range. The range control on the EX5000 enables you to zoom in or out to see the distribution of convective activity.

If both datalink weather and TWX670 are installed in the aircraft, you can use both to determine the best course of action to avoid dangerous weather.

- **RADAR** - Displays on-board weather radar returns on the map. This choice does not appear if the EX5000 is not configured with an aircraft heading source, or if aircraft heading is currently unavailable.
- **DSPLY OFF** - Removes all onboard and datalink radar data from the map display.
### Map Page

#### Note:
Gray diagonal stripes indicate the boundary of available datalink radar data. If datalink radar is unavailable in a particular area, hatched lines appear in that area.

#### 3) Range Control knob—
The right knob controls the map’s range and allows you to set the scale from 1NM out to 1500NM. The selectable ranges are, in nautical miles, 1, 2, 5, 10, 15, 20, 30, 40, 50, 75, 100, 150, 200, 300, 400, 500, 750, 1000, and 1500.

**Note:** The terrain base map is automatically removed and Nav database information is fully decluttered at 750NM and higher ranges.

**Note:** The Map page monitors the “health” of the sensors (traffic and lightning) by means of a signal pulse. Map looks for a signal every three seconds from each sensor. If it doesn’t see this signal it assumes the sensor has failed in some way. When this happens, the following occurs on the display:

- Sensor data is removed from the overlay display.
- The word “FAIL” displays in the sensor's status line in yellow.
- The sensor symbol changes from cyan to yellow (if the sensor was on).

What to do:

Select the Setup page and perform Self-Test for the applicable sensor.
2.2 Map Symbols—Terrain and Position

The Map page depicts your aircraft’s position in relation to your flight plan, nearby airports, terrain, traffic, lightning, special use airspace and other navaids.

**Note:** For details about the Map Symbols, see Section 12.5, "Map Symbols" on page 122.

---

**Figure 2.3 Map Page Symbols—Terrain and Position**

1) **Data Blocks (Left & Right)**—View navigation and engine (when equipped with engine monitor) data in data blocks in the upper corners of the display. For more information, see Section 10.4, "Data Block Edit Page" on page 95.

2) **Heading/Track Indicator**—Three triangles around the compass rose provide actual track, desired track, and heading indications. The H/T Block provides digital readout of the current heading, or actual track. Map orientation is indicated in the triangle to the right of the H/T Block.
Table 2.2 Track Indicator Graphics

<table>
<thead>
<tr>
<th>Heading</th>
<th>Track</th>
<th>Map Orientation</th>
</tr>
</thead>
<tbody>
<tr>
<td>011</td>
<td>Desired Track</td>
<td>North Up</td>
</tr>
<tr>
<td>193</td>
<td>Heading</td>
<td>Heading Up</td>
</tr>
<tr>
<td></td>
<td>Actual Track</td>
<td>Track Up</td>
</tr>
</tbody>
</table>

3) **Sensor Status Box**—Displays the status of the available sensors including radar, traffic, lightning and both 2-Way Datalink and Broadcast Datalink. The Datalink Radar display includes the Datalink Radar data age, which is the elapsed time since the product was created by the weather provider. See Table 12.1 Sensor Status Block Symbols on page 120 for more information on status box symbols. (Optional Engine Instrument Sensor Status information is described in Table 12.10 Engine Instrument Data Block Information on page 126).

! When using Datalink weather, monitor the data age so you are aware of the time elapsed since the last weather update.

4) **Compass Rose/Range Ring**—Displays a 360-degree or 120-degree compass circle or arc and indicates current range setting. The range number is the distance from the airplane symbol to the compass arc.

**Note:** Datalink Radar is the only Broadcast Datalink product on the EX5000 that displays the time since the product was created by the weather provider. Refer to the Trip page for information on all other weather products.
5) **Terrain Scale**—Shows highest and lowest limits of terrain in displayed area. Legend colors in between these numerics represent terrain elevations. Blue obstacle clearance number shows the top of the highest obstacle, when greater than the highest displayed terrain. Terrain data is not displayed when your aircraft’s latitude is greater than 75 degrees (north or south).

The displayed terrain and obstacle indicators are only advisory. It is dangerous to rely on the EX5000 as the sole source of obstacle and terrain avoidance information. Always refer to current aeronautical charts for appropriate terrain and obstacle information.

6) **METAR Flags**—For each reporting airport, when Datalink is installed and active, a METAR flag provides a quick overview of the weather for that station. The METAR flags are color-coded:

7) **Interstate Highways**—Depicted as brown lines when terrain is selected to be shown. Interstates are labeled in white. (e.g. I-95). Highways are removed from the terrain map when the range is greater than 300NM.

8) **Lightning and Storm Cell Indications** - Displays geographically referenced lightning strikes (if configured). Strikes are represented by a yellow X ( ) in Strike Mode and by a yellow + ( ) in Cell Mode (WX-500 only). Strikes from a Broadcast Datalink system are represented by a lightning bolt symbol in one of three different colors, depending on the age of the strike.

If you have Broadcast Datalink, and depending on your level of service, storm cells will show speed and direction of movement. The underlined number indicates the tops of the storm cells, in hundreds of feet. The storm cell indicators are black for rain (or snow) and white to show probability of hail. In the example, the bottom storm cell, which includes the probability of hail, is moving NNE at 33 knots. The cell top is 35,000 feet high.
Note: At longer range settings, individual lightning strikes and storm cells are combined into single strikes or single storm cells, depending on their proximity. This avoids clutter and improves readability. And vice versa, lower map range settings will display more strikes and storm cells.

If Broadcast Datalink is installed and you have an appropriate broadcast datalink service level, shows as color-coded lightning symbols. Datalink strikes darken in color until they are removed after 15 minutes.

9) Special Use Airspace—The EX5000 uses several different line styles to convey special use and class airspaces. Class B is solid blue line, Class C is solid magenta line. Class D is dashed blue line, MOA, Warning, and Alert areas are solid yellow lines, and restricted and prohibited areas are solid red lines. See Table 12.7 Airspace and Airways Lines on page 124.

Do not rely on the EX5000 as your sole source for SUAs. The status of SUAs may change or may be unavailable. Before conducting a flight, always confirm the state of SUAs with FAA Flight Service.

10) Storm Cells—If storm cells are present, the EX5000 displays the cells along with the cell’s groundspeed, in knots, and direction of travel, and it shows the cell echo tops with a label. If there is a greater than 50% chance of hail, the cell displays with a white background.
2.3 Map Symbols—Runways and Flight Plan

When looking at the Map page in short range, you can see details, such as runway diagrams, that are not available at longer ranges. Note that your flight plan is always shown.

Figure 2.4 Map Page Symbols—Runways and Flight Plan

1) **Ownship Symbol**—Shows the position of your aircraft in relation to the moving map and the selected view.

2) **Airport Runway Diagrams**—Displays runway layouts of nearby airports when looking at the map at a less than 5NM range. As you range in, the scaled runway diagram with heading labels shows your exact location in proximity to the field.

3) **Traffic Indications**—Shows traffic symbol relative to current position and includes relative altitude (when available) with respect to airplane symbol. See your traffic sensor User’s Manual for further details. When available, TIS installations will show a ground track “stinger” for each intruder, indicating the intruder’s track as measured by ground radar. Traffic Symbols are shown in Table 3.1 Traffic Symbols on page 26.
4) **Flight Plan**—Displays the active flight plan from the GPS. The current leg displays in magenta and all remaining legs are shown in white. When you select an approach procedure on the Garmin 430, all approach segments including holds, DME arcs, procedure turns, etc., are shown (when connected via the ARINC 429 bus).

5) **Obstacles**—The EX5000’s database contains towers and other obstacles greater than 200 feet AGL. Obstacles can be displayed with MSL altitude label. For example, a 2000 foot tall TV tower located in Denver (elevation 5300 feet MSL) will be depicted as being at 7300 feet MSL.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Note:** The Garmin GNS 430/GNC 420 does not differentiate curved flight path segments from straight segments when interfaced with the EX5000 via an RS232 interface. Therefore, the EX5000 will connect the beginning and end waypoints of a curved segment, such as a DME arc, with a straight line. Under these circumstances, the straight line must be ignored. Approach procedures should be flown using the GNS 430/GNC 420 navigator’s CDI as the primary reference. Consult your avionics installation facility to determine if your EX5000 is interfaced to the GNS 430/GNC420 via ARINC 429 or RS232.

**Note:** For most GPS units, the EX5000 does not display the active course leg when you are adjusting the desired track in OBS mode. The desired track leg will display after you finish selecting the course and exit the OBS mode of the GPS.
2.4 Map Orientation Control

The Map View button allows you to control the orientation of the map and sensor data displayed on the EX5000. EX5000 traffic and lightning sensor symbols are positioned relative to the aircraft nose. If Map View is North-Up, you need to pay more attention to locate traffic outside the aircraft. Set Map View to Center or Forward to display this data for typical dedicated traffic and lightning sensor displays.

2.5 Errors Displayed on the Map Page

In general, the following errors are externally generated, but you may notice them on the Map or other pages on the EX5000.

2.5.1 Loss of GPS Input

Loss of primary GPS is annunciated in a number of ways on your EX5000.

- The "Nav Source not communicating" message displays.
- The aircraft symbol is removed.
- There is no heading information displayed (if GPS is lost, no heading is displayed regardless of heading source).
- The desired track icon is removed from the compass rose.
- There is no groundspeed information displayed.

The EX5000 continues to provide Datalink weather for your flight at its last known position. If the primary GPS fails during flight and you have a second GPS connected to the EX5000, you may switch your GPS input to the backup source by pressing the Nav Src button on the Aux page.
2.5.2 Loss of Heading Input

The source for heading data on your aircraft is dependent upon the particular complement of equipment you have installed in your aircraft. Loss of heading is typically associated with the failure of one of the following:

- The WX-500 Stormscope system (if installed and a heading source is connected to the WX-500).
- The Skywatch system (if installed and a heading source is connected to the TAS).
- A problem with heading from a Primary Flight Display (PFD).
- The GPS (This would be a pass through of the heading from another source, such as an Avidyne PFD. The GPS does not determine heading).

If an installed heading source becomes unavailable or invalid, the EX5000 will automatically switch to using GPS track for map alignment.

If the track source also becomes unavailable or invalid, the following conditions will occur:

- All traffic and lightning data is removed from the display.
- The aircraft symbol is replaced by a direction-less symbol (a white + symbol).
- The compass labels (N, S, E, and W) are removed from the display.
- The map and flight plan data will continue to be displayed.
- The map orientation annunciation is removed from the display.
- The heading/track indicator will display a series of dashes (‘‘---’’).
- The map is oriented True North Up.

What to do:

- Have the avionics wiring inspected.

When heading/track is restored, Map will resume normal operations.
3 Traffic Mode and the Traffic Page

When a Traffic Advisory (TA) is reported from the traffic sensor, the EX5000 displays a traffic alert message in the Message Bar. Pressing the ACK button next to the message acknowledges the traffic alert and displays the dedicated traffic page that provides you maximum traffic situational awareness.

It is dangerous to rely on the EX5000 as your sole source of data for collision avoidance. Traffic information is provided as an aid to visually acquiring traffic. Maneuver your aircraft based only on ATC guidance or positive acquisition of conflicting traffic. It is your duty as pilot in command to see and avoid.

Notes: The intruder track information provided by TIS traffic systems is only accurate to within 45° of true intruder track. Take this into account when visually acquiring the reported traffic.

Keep in mind that intruder traffic can maneuver at any time, and the current intruder track direction does not guarantee the intruder will continue along that track.

For traffic sensors without track information (e.g. TAS), traffic symbols are shown without the “stinger”.

3.1 The Dedicated Traffic Page

The Traffic page is a specially configured Map page with the following settings:

- **View**—Center, with heading (or track) up
- **Range**—5 NM
- **Base Map**—No terrain or political boundaries
- **Declutter**—No symbol or airspace depictions
- **Lightning**—Not displayed
- **Flight Plan**—Displayed
Traffic Mode and the Traffic Page

- **Datalink Weather**—Not displayed.

Up to 5 non-bearing intruders (traffic threats reported by the traffic sensor without valid bearing) are listed below the airplane symbol.

Acknowledging the TA message from the Traffic mode removes it from the message bar, allowing other messages to be displayed. The TA message is automatically removed when the threat is reduced or the intruder is no longer present.

![Figure 3.1 Map Page—Traffic Mode](image)

1) **Exit Traffic**—Restores the Map page to the previous settings. If the Map page is restored prior to acknowledging a TA, the message will remain displayed and acknowledging it will once again bring up the dedicated Traffic page.

**Note:** Traffic limitations and operational ranges depend on the installed traffic sensor. For TAS or TCAD sensors, see the corresponding sensor Pilot Guide. For TIS sensors, see Section 1-3-5 of the Aeronautical Information Manual.

The available **Traffic** button modes are listed below. For more information on specific traffic sensor modes, consult the user documentation for your traffic sensor.
The Dedicated Traffic Page

- **TCAD 9900B**—Traffic modes are GROUND, TERMINAL, STANDARD, ENROUTE, UNLIMITED, APPROACH, and DSPLY OFF. Note that some TCAD installations will support automatic mode switching by the TCAD unit. The current mode is always reported on the EX5000 screen.

- **TIS**—Traffic modes are DSPLY ON and DSPLY OFF.

- **All others (ARINC 735 devices)**—Traffic modes are ABOVE, NORMAL, UNLIMTD, BELOW, and DSPLY OFF.
3.2 Traffic Symbols

On the EX5000, aircraft traffic detected by a Traffic Sensor (referred to as intruders) are displayed as one of three symbols. If a compatible TIS system is installed and intruder track information is available, the appropriate symbol will be shown with a “stinger” which depicts the current ground track of the intruder, as detected by ATC radar systems. The traffic symbols are:

Table 3.1 Traffic Symbols

<table>
<thead>
<tr>
<th>Non-TIS Symbol</th>
<th>TIS Symbol</th>
<th>Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Traffic Alert" /></td>
<td><img src="image2" alt="Traffic Alert" /></td>
<td>Traffic Alert (TA)</td>
<td>Traffic within the alert zone defined by the traffic sensor.</td>
</tr>
<tr>
<td><img src="image3" alt="Proximate Traffic" /></td>
<td><img src="image4" alt="Proximate Traffic" /></td>
<td>Proximate Traffic</td>
<td>Traffic close to your position but not within an alert zone.</td>
</tr>
<tr>
<td><img src="image5" alt="Other Traffic" /></td>
<td><img src="image6" alt="Other Traffic" /></td>
<td>Other Traffic</td>
<td>Traffic detected by the traffic sensor, but determined not to be a current threat.</td>
</tr>
</tbody>
</table>

Traffic sensors do not provide any traffic awareness data for aircraft without operating transponders. Therefore, these aircraft will not display on the EX5000. It is your responsibility to see and avoid all other traffic and to maintain appropriate separation.

Traffic alert information is displayed in the message bar as in the example above.

1) Relative bearing of target.
2) Range in nautical miles.
3) Relative altitude of traffic to your current aircraft altitude. For example, -200 would be 200 feet below your aircraft, as reported by the traffic sensor.

Intruders are displayed as they are received from and identified by the sensor. The threat level assigned to an intruder is specified by the sensor when it transmits the intruder data. Threat data, range, bearing, altitude, ID and closing direction are defined by the sensor and the type of system.

If the intruder altitude and vertical speed are known, they are displayed alongside the intruder symbol. The number immediately above or below the traffic symbol indicates the relative altitude of the intruder to your position, in hundreds of feet. An arrow next to an intruder symbol shows the direction of any vertical movement of the intruder that is in excess of 400 feet per minute.

For example, in the Traffic Alert example shown in Table 3.1, the intruder is 500 feet below and is climbing. In addition, the TIS example shows the intruder is moving along a track approximately 45 degrees to the right of our current map alignment. (i.e. if the EX5000 map is set for North Up, the intruder is flying a track somewhere between 023 and 067. This is the accuracy limit of the intruder track data.)

### 3.3 TIS Sensor Status

The TIS interface is only available on the EX5000. For TIS installations, the following may be reported in the Traffic status block on the Map page:

- **OPER**—The TIS sensor is operating normally.
- **CST 00:00**—The TIS sensor has temporarily lost the information feed from ground-based radar and is in “coast” mode. The EX5000 will continue to display the traffic last received, while the CST timer will count the seconds since the last valid data.
- **RMV 00:00**—After 12 seconds of coasting, the TIS sensor will remove the traffic display and display RMV, and continue to count the time since the last valid data.
- **UNAVAIL**—More than 60 seconds have passed since valid data was received, or TIS data is not available at the current aircraft location.
Traffic Mode and the Traffic Page

- **SBY**—The TIS sensor is in standby mode.
- **DATA FAIL**—The TIS sensor has reported an internal fault. Traffic information will be removed from display.
4 TAWS Page (Optional)

If your EX5000 system has been configured with a Terrain Awareness and Warning System (TAWS), turn the Page knob to “TAWS” to view the TAWS page.

- Any display of yellow or red on the TAWS page indicates an imminent terrain or obstacle hazard.
- The TAWS display on the EX5000 is an optional component of any TAWS-B installation, and is intended only to enhance situational awareness. All terrain avoidance maneuvering must be predicated on indications from the installed TAWS system, and not from the EX5000.

4.1 TAWS Information

Figure 4.1 TAWS Information
1) **Range Annunciation**—The range number indicates the currently selected range as selected by the Range knob. The supported ranges are 2.5, 5, 10, 20, 40, 80, 160, 240, and 320 nm. At start up, the EX5000 TAWS range defaults to 80nm.

2) **Display Orientation**—This annunciation describes the orientation of the TAWS display. If heading is available to the EGPWS, the TAWS display orientation is “heading up”, with the aircraft's heading to the top of the display. HDG ### MAG displays, where ### is the aircraft's magnetic heading as reported by the EGPWS.

   If heading is lost or not available to the EGPWS, the EGPWS may use magnetic ground track instead, and TRK ### MAG displays, where ### is the aircraft's magnetic ground track.

   In certain locales, such as near the magnetic poles, magnetic variation may become unreliable. The Display Orientation will switch to the “true” value, for example, HDG ### TRU or TRK ### TRU.

   If neither heading nor ground track is available, the terrain will be replaced by the cyan message “TAWS Display Unavailable”.

3) **Scan Marker**—The marker is a short white line that moves across the top of the display area. It indicates the current position of the scan.

4) **Peaks Mode Elevations**—Appears only when your EGPWS has been installed with the “Peaks Mode” option selected. The two numerical values correspond to the highest terrain/obstacle elevation displayed and the bottom elevation of the lowest color band displayed. Elevations are expressed in feet above sea level, with the hundreds digit displayed half size, i.e. 108 is equal to 10,800 feet and 010 is equal to 1,000 feet.

   If there is no appreciable difference in elevation (flat terrain) only the highest value displays. The color of each elevation value is the same as the color of the terrain display containing that elevation (green, yellow, or red). During a terrain alert, threatening terrain will be displayed as bright red and/or bright yellow. The elevation value colors are not modified in this case, but continue to correspond to the colors that would appear in the TAWS display under normal circumstances, and represent the actual elevation of the terrain relative to the aircraft.
5) **Range Rings**—Range rings are shown as solid white lines. The distance to the outer ring is shown in the Range annunciation. The inner ring is one half the range of the outer ring.

6) **Terrain Data**—Terrain data is depicted as color areas representing various elevations relative to your aircraft and potential hazard situations.

7) **Azimuth Lines**—When pressed, labeled azimuth lines appear every 20 degrees. Press it again to remove the azimuth lines.

8) **Geometric Altitude**—Presents current geometric altitude as calculated by the EGPWS. The geometric altitude is calculated via GPS altitude reporting.

9) **Range knob**—Changes the TAWS display range. During the short delay between the request for a new range (by turning the range knob) and the actual display of data at the new range, a "Requested Range Annunciation" displays. This is a dashed box immediately below the Range Annunciation, containing the new range that has been requested. If too many TAWS range requests are made before the EGPWS completes a full scan, the display may temporarily say "TAWS Failed", but will resume normal operation within a few seconds.

---

**Note:** The EX5000 displays TAWS data that is received from the TAWS sensor. The EX5000 does not generate its own TAWS data.

---

- **MSL-G** is based on an internally calculated geometric altitude by the TAWS. Geometric altitude is the height above MSL derived from GPS. It represents the aircraft's calculated height above MSL and serves as the reference altitude for color-coding of the TAWS terrain display and as the input to the TAWS look-ahead algorithm. Because it is derived from GPS altitude, this reference altitude will often differ from corrected barometric altitude. The geometric altitude, which may be in error by 100 feet or more, is not to be used for navigation. It is presented to provide the crew with additional situational awareness of true height above sea level upon which TAWS terrain alerting and display is based.
4.2 TAWS Operation

Terrain and obstacle alerts are the most critical situations displayed by TAWS. There are two levels of alerts:

- **Caution**—Possible terrain or obstacle conflict within 40-60 seconds.
- **Warning**—Possible terrain or obstacle conflict within 30 seconds.

**Note:** At the maximum range settings of 240nm and 320nm, terrain data for portions of the display beyond 320 nm may not be available. At these range settings, portions of the display representing distances greater than 320 nm may be black even though significant terrain may be present. The occasional loss of this display data occurs at the extreme limits of the EGPWS, but does not compromise safety or terrain awareness.

When a caution alert is triggered, the terrain or obstacle that caused the alert displays in bright yellow, as shown below. In addition, a message describing the nature of the alert is presented in the message bar.

![Figure 4.2 Terrain Caution Condition](image)

Entegra EX5000 -32- 600-00108-003 Rev 01
When a warning alert is triggered, the terrain or obstacle that caused the alert displays in bright red. In addition, a message describing the nature of the alert is presented in the message bar.

![Figure 4.3 Terrain Warning Condition](image)

When a caution or warning alert is active, the display image surrounding the target is enlarged somewhat to allow the terrain or obstacle to be better seen on the display. See Table 12.8 TAWS Messages on page 127 for a complete listing of TAWS messages.

If a terrain or obstacle alert occurs while a page other than TAWS Display is being displayed, a terrain or obstacle alert message displays in the Message Bar. When you acknowledge this message, the EX5000 automatically switches to the TAWS Display page. The message bar is removed from the display when the EGPWS is no longer in alert status, or if you acknowledge the message from the TAWS page.
4.3 TAWS Reference

4.3.1 Auto-Range

If the EGPWS has been installed with the “auto range” option selected, the terrain display range is automatically set to 10nm whenever a terrain or obstacle alert takes place, overriding the current range selection. To remind you that the range has been automatically changed, the text “Auto” is added in the range annunciation. Manual range control is not disabled by auto-range. You can reset the range to any desired value.

4.3.2 Simultaneous Alerts

If a terrain or obstacle alert and Traffic Advisory (TA) are issued at the same time, TAWS will have priority, and the terrain or obstacle alert message will be presented in the Message Bar. When you acknowledges the alert, the EX5000 switches to the TAWS Display page. After you acknowledge the TAWS message from the TAWS page, the TA is shown in the Message Bar. If you then acknowledge the TA, the dedicated Traffic page, discussed in Section 3.1, “The Dedicated Traffic Page” on page 23, will pop up.

If a TA occurs while a terrain or obstacle alert is in progress and the TAWS Display page is being displayed, the EX5000 will remain in TAWS Display and the TA message will appear in the Message Bar. Acknowledging the TA message displays the dedicated Traffic page.

4.3.3 Terrain Messages and Error Indications

The TAWS display may present messages in the Message Bar. Press the ACK button to acknowledge TAWS page messages and remove them from the message bar. Large text annunciations will remain. See Table 12.8 TAWS Messages on page 127 for a listing of possible TAWS messages.

If the TAWS page is accessed immediately after you turn on the EGPWS, the system may still be initializing and the TAWS page will display the text “TAWS Initializing” rather than the expected terrain. The EGPWS and TAWS page will begin normal operation when initialization is complete.

</table>
5 Trip Page

The Trip page is continuously updated during flight. The distance and the time values are updated with each new positive fix from the GPS. The route legs advance with each waypoint message. Turn the Page knob to bring up the Trip page, which shows the remaining legs in the current flight plan and other data being received by the EX5000 from the GPS.

If the entire flight plan does not fit on the screen, an ellipsis (...) displays in the next to last line. The destination line is always displayed. All flight plans are from the GPS. A “No Flightplan Available” message displays if there is no flight plan entered or if the GPS has failed.

5.1 Trip Page Information

1) Current ground speed and track—As reported by your GPS Navigator.
Trip Page

2) Course Deviation Indicator (CDI)—Shows lateral distance (Crosstrack deviation) from desired course, providing continuous navigation reference when viewing the Trip page.

3) Time—Local and UTC time in HH:MM:SS using a 24-hour clock format.

4) Flight Plan Waypoints—Flight Plan information from your GPS. Active waypoint is shown in magenta.
   - For Flight Plan waypoints, the following data displays:
     - **WPT**—Waypoint identifier as received from the GPS.
     - **BRG**—Bearing to current waypoint.
     - **DTK**—Desired track to waypoint.
     - **NM**—Cumulative great circle distance of each flight plan leg.
     - **ETE**—Cumulative estimated time enroute to waypoint in H:MM format for each flight plan leg at current ground speed.
     - **ETA**—Estimated time of arrival to waypoint in HH:MM formatted for local time.
     - **Fuel (Gals)**—Available with Engine and Fuel Monitor function. Displays remaining fuel at each waypoint.

**Note:** For the Garmin 430W, if the parallel track is active, the above data, WPT, BRFDG, DTK, NM, ETE, ETA and Fuel (Gals) are not displayed.

- **Chart Icon**—Indicates that an Instrument Procedure chart is available for the associated airport. An "I" on the icon indicates that at least one ILS approach chart is available for the associated airport, on the CMax Chart page. Chart icons only display for those airports for which you have JeppView subscription coverage. For more information, see Section 8.1, "About CMax" on page 57.

- Intermediate waypoints are shown with the prefix Wx:. The Trip page includes distance (NM), waypoint name, and METAR, if available.

*Intermediate waypoints are determined by your current flight plan. The EX5000 adds intermediate waypoints along your*
flight path to provide weather information between flight plan waypoints for longer flight plan legs. This can provide you with a fuller picture of enroute conditions.

5) **METAR Symbol**—A METAR report is shown for each flight plan waypoint that uses the same METAR condition symbols as described in Section 2.2, "Map Symbols—Terrain and Position" on page 15. For ADS-B configurations, Icons will be displayed to indicate the availability of TAF and Winds & Temps data for flightplan waypoints.

6) **Trip Display Area**—Displays the information that you select with the Display button for the selected waypoint, when available.

7) **Destination Airport Info**—Provides quick access to airport information for the destination airport, when available.

8) **Display**—Controls the display shown in the lower portion of the screen. The selections are:

   - **METAR**—Displays the decoded text METAR for the selected waypoint, when available. If METAR cannot be decoded, raw text METAR will be displayed.

   - **Legend**—If Broadcast Datalink is installed, shows the types of data used in graphical METAR and Datalink Radar displays. If LEGEND is selected for the Trip page display, there will be a button presented to allow for unit selection. The unit selection controls the units used for decoded METARs and Datalink Legend. Unit selections apply to decoded METAR text on both the Trip page and Nearest page.

   The possible values are:

   - **ENGLISH** Displays the decoded METAR text and Datalink Legend using statute miles (SM), feet (ft), and inches of mercury (inHg)

   - **METRIC** Displays the decoded METAR text and Datalink Legend using meters (m), kilometers (km), and hectopascals (hPa). Cloud altitudes are still in feet (ft).
**Broadcast Status**—If Broadcast Datalink is installed and available, displays satellite, signal and serial number information for the Broadcast Datalink system. Also displays the elapsed **time since reception** of the various types of weather data. If the time since reception for any particular weather product is greater than the limits defined by the system, a cyan alert message will display in the message box on the Aux Main page and in the message bar. For example, if 91 minutes has elapsed since the last TAF data was received, a "Broadcast TAFs > 90 min" message will display in the message bar and in the message list on the Aux page. When these messages are displayed, all data for that product is removed from the MFD. The Trip page will indicate that new data for that product has not been received for greater than X minutes, where ‘X’ is the time limit defined for each product (typically 90 minutes).
Winds Aloft and Freezing Level/Temperatures Aloft—
Depending on your XM WX service level, displays Winds Aloft and Freezing Level (XM) data from Broadcast Datalink, if available. The Winds Aloft direction is measured from true (not magnetic) North. Winds are interpolated for each Trip page waypoint and are based on a computer forecast model that is updated hourly. The XM Freezing Level forecast (see figure) displays the expected altitude of the freezing level for the waypoint.

TAFs—The EX5000 provides text Terminal Aerodrome Forecasts (TAF) from the National Weather Service via Broadcast Datalink, if available. TAFs are not decoded.
9) **Chart**—If CMax approach charts are installed and available, provides a quick jump to the Chart page with the highlighted airport pre-selected. For information about CMax, see Chapter 8 "CMax Chart Pages (Optional)".

10) **Select knob**—Use the right knob to move the cursor over the desired waypoint in the flight plan, which selects the plain-text METAR to be displayed along the bottom half of the screen.

11) **ADS-B Status** -- If the EX5000 is configured with for ADS-B weather, the Trip page will have a "Status" button. Pressing the button will cycle through the following sub-pages

- **Products**: This is the standard Status page which display the product ages and receiver status
- **Stations**: This page shows information about which stations are providing data and the completeness of that data. White text in the CRL (Current Report List) Range columns indicates that additional data is expected.

**Garmin GNS400/500-series users**: When the EX5000 is interfaced to a Garmin GNS400/500-series GPS via RS-232, the GPS may send duplicate waypoints while in approach mode. These duplicate waypoints may affect the distance and time readings on the Trip page. Use the GPS as the primary source of navigation information for approach procedures. Consult your avionics installation facility to determine if your EX5000 is interfaced to the Garmin GNS-430 via ARINC 429 or RS-232.

**Note**: Winds Aloft and TAFs are only available with certain broadcast packages. See the broadcast datalink documentation for more information.
Figure 5.2 ADS-B Station Status Page

This page shows information about which stations are providing data and the completeness of that data. White text in the CRL (Current Report List) Range columns indicates that additional data is expected.

Figure 5.3 ADS-B Unavailable Product Page

This page displays information about products that are being reported as temporarily unavailable.

- B Product Updates Unavailable
  - 1718Z ZAU, ZEW, ZNY TFR, NOTAM
  - 1718Z ZD, ZHU METAR
  - 1718Z ZLA, ZOA NEXRAD IMAGERY
  - 1718Z ZID, ZJX SIGMET / CONVECTIVE SIGMET
5.2 Trip Page with Datalink Weather

The EX5000 Trip page also displays weather information from the weather Datalink. Each waypoint on the current active flight plan is associated with a METAR reporting point. For non-airport waypoints, the nearest METAR is used. The general conditions are reported with the same METAR flags as used on the Map page, here shown in a column for each waypoint. If legs on the flight plan exceed 100 miles in length, the EX5000 selects “intermediate waypoints” in between the waypoints of the leg, to provide greater situational awareness of the weather conditions along the route.

![Figure 5.4 Trip Page with Datalink Weather](image)

For information about Datalink weather on the Trip page, see the discussion of the Display button options beginning on page 39.
6 Nearest Page (NRST)

The Nearest page displays the nearest airports within 100NM of your present position or the nearest airports to your destination. Through the buttons, you can access detailed information about each airport. The buttons also allow you to view the nearest VORs, NDBs, Intersections, and Obstacles.

6.1 Nearest Page

The Nearest page also displays METAR information received via Datalink. Similarly to the Trip page, the METAR symbols are displayed in a column next to the Nearest airports list, for all airports that have weather reporting stations. Airports that do not report METARs do not have a METAR symbol shown. When Broadcast Datalink is enabled, the text METAR for the currently selected airport is displayed on the lower half of the Nearest page.
1) **Airport details**—By default, displays the following details about the airports nearest to your current location:

- **METAR and Chart Symbols**—Waypoints with METAR reporting stations display a color-coded METAR flag when Datalink is active. If CMax approach charts are installed, a chart icon displays next to any METAR reporting station for which an Instrument Procedure chart is available. An “I” on the icon indicates that at least one ILS approach chart is available. See *Chart*, below, for more information.
- **ID**—Airport identifier of the airport.
- **BRG**—Bearing to the airport.
- **NM**—Distance to the airport.
- **Freq**—Radio frequency to contact this airport.
- **Name**—Airport common name.

2) **METAR Conditions**—Displays the decoded text METAR for the selected airport when Broadcast Datalink is enabled and a METAR is available.

3) **Airport Info**—Provides quick access to airport information for the airport highlighted. *Airport Info* only appears when viewing the *Airports Nearest to Position* and *Airports Nearest to Destination*. *Airport Info* displays a page similar to Figure 6.2.

4) **TYPE**—Cycles through the various Nearest data types in the following order:

- **PPOS APT (Airports Nearest Present Position)**—Graphical METARs, airport identifier, bearing, distance from the aircraft present position, frequency, and airport name.
- **DEST APT (Airports Nearest Destination)**—Graphical METARs, airport identifier, bearing, distance from the destination airport, frequency, and airport name.
- **VORs**—Identifier, bearing, distance, frequency, and name.
- **NDBs**—Identifier, bearing, distance, frequency, and name.
- **Intersections**—Identifier, bearing, and distance.
- **Obstacles**—MSL (and AGL) height, bearing, and distance.
5) **FILTER**—Press to see all airport types (SHOW ALL) or only the airport types as defined on the Airport Filter page (ON) (see Section Figure 10.2, "Airport Filter Setup Page" on page 91). *Filter* is only visible on the Nearest Airport pages.

6) **Chart**—If CMax charts are installed and you select an airport that has a chart icon, the *Chart* button appears, which provides a quick jump to the selected approach charts. For information about CMax, see Chapter 8 "CMax Chart Pages (Optional)."

7) **Select knob**—Use the right knob to move the cursor up or down to highlight a specific airport or other data type.
6.2 Airport Info Page

When you press Airport Info from the Nearest page, the Airport Information page displays for the selected Airport, as shown:

![Airport Information Page](image)

Figure 6.2  Airport Information Page

1) **Back to Nearest**—Returns to the Nearest page.

2) **Step and Jump knobs**—If the communications frequencies list is long enough so that it does not fit on a single page, the Step and Jump labels appear on the left and right knobs:
   - **Step**—Scrolls the page one line.
   - **Jump**—Scrolls an entire page (or to the end of the list).
7 Checklists

Checklists provide step-by-step instructions to help you perform common, and uncommon, tasks relating to your aircraft. There are two ways to access the Checklists:

● For normal Checklists, turn the Page knob to Chklist. As described in Section 7.2, "Normal Checklists" on page 50, the left-hand buttons display the types of available checklists.

● For Emergency Checklists, press the Emerg. Chklist button available on every page. This will take you directly to the Emergency Checklist section, described in Section 7.4, "Emergency Checklists" on page 53.

This section discusses the following topics:

● Checklist Versions, page 49
● Normal Checklists, page 50
● Checklist Buttons and Knobs, page 52
● Emergency Checklists, page 53
● Performance Checklists, page 56

7.1 Checklist Versions

The EX5000 startup screen and the Aux Main page display the currently loaded checklist version. While the checklist version reflects the current MFD software part number, checklists may be updated by Columbia in the future.
7.2 Normal Checklists

1) Checklist Types—Provides access to the top-level Normal checklists by phase of flight:
   - Before Takeoff
   - In Flight and Landing
2) **Available Checklists Menu**—Lists the checklists within each type. Press *Show Checklist* to view the highlighted checklist. Normal Checklists will automatically sequence in order as checked off.

3) **Perf. Data**—Displays the list of Performance Data Checklists, described in Section 7.5, "Performance Checklists" on page 56.

4) **Emerg. Checklist**—Displays the list of Emergency Checklists, described in Section 7.4, "Emergency Checklists" on page 53.

5) **Show Checklist**—Press *Show Checklist* to view the highlighted checklist.

6) **Selection Control**—Use right knob to move the blue outlined box up or down to highlight a specific checklist within each menu for viewing.
7.3 Checklist Buttons and Knobs

1) **Next Checklist**—When the current checklist is completed, indicated by all steps appearing green and checked off, press "Next Checklist" to view the next checklist in sequence.

2) **Done/Undo**—Press *Done* to change the current checklist item to green, place a checkmark to the right of it, and automatically step down to the next checklist item.

   If an already-acknowledged checklist item is highlighted, the *Done* button will be relabeled *Undo* allowing the item to be reverted to the undone state.

3) **Back**—Returns you to the menu of checklists in each type.

4) **Selection Control**—Once inside a Checklist, use the right knob to move up and down the checklist. The current step in the checklist is highlighted in magenta and has an arrow pointing to it from the right side.

![Figure 7.3 Example Normal Checklist](image-url)
7.4 Emergency Checklists

The EX5000 includes complete Emergency checklists. To access the Emergency checklists, press the Emerg. Checklist button in the lower left corner.

Figure 7.4  Emergency Checklists

1) Checklist Types—Provides access to the top-level Emergency checklists for each phase of flight including:

- Ground Emergency
- In-Flight Emergency
- Landing Emergency
- System Malfunctions

2) Normal Checklist—Press Normal Checklist to return to the selection of normal operating checklists.
3) **Available Checklists**—Menu of checklists within each type. Push *Show Checklist* to display the desired list.

4) **Show Checklist**—Press *Show Checklist* to view the highlighted checklist.
5) **Selection Control**—Use right knob to move the blue outlined box up or down to highlight a specific checklist within each menu for viewing.
7.5 Performance Checklists

The Performance Data tables and charts are accessible from the Normal Procedures page. All data is derived directly from the aircraft POH.

The available charts are:

- Airspeeds for Normal Operation
- Wind Components
- Takeoff Distances
- Cruise Performance
- Landing Distances

In all airspeed and performance tables, the POH contains the most complete data available.
8 CMax Chart Pages (Optional)

CMax™ is an optional Avidyne feature that allows you to view Jeppesen Terminal charts on your EX5000. The EX5000 starts in Night mode to preserve night vision. If CMax is installed on your aircraft, you can select Charts from the Page Bar to view the CMax charts. This section discusses the following topics:

- About CMax, page 57
- CMax™ charts are valid for a period of 56 days. Charts will be displayed normally for 10 weeks after the chart expiration date., page 58
- Chart Selection Page with VFR and IFR charts listed, page 60
- CMax Views, page 65
- CMax Selection Page, page 69

As pilot in command, it is your duty to have alternate sources of approach data available to you. Do not rely upon CMax charts as your sole source of navigation information.

It is critical that you update the Jeppesen database regularly and prior to conducting flight operations to insure accurate data. Use of an outdated database is entirely at your own risk.

8.1 About CMax

CMax charts include instrument approach procedures, arrivals, departures, airport diagrams, and various taxiway and airspace diagrams typical of Jeppesen printed charts. The CMax feature requires that you have a valid chart data subscription from Jeppesen Sanderson, Inc. For information on obtaining a CMax subscription, see the Avidyne Data Update Guide or the Jeppesen website at www.jeppesen.com.

The Data Update Guide also contains instructions for loading the chart data to your Zip Drive or USB Flash Memory Drive. See Section...
12.1.2, "Loading CMax Chart Data" on page 114 for information about loading CMax Data onto your EX5000.

**Note:** You can load new CMax Chart data into the MFD as soon as you receive each data cycle. Any charts that have changes that are effective on a certain date are controlled within the data. The MFD will display the proper Chart data based on the current date and the effective date of the changes to the chart.

### 8.2 Expired Charts

CMaxTM charts are valid for a period of 56 days. Charts will be displayed normally for 10 weeks after the chart expiration date.

After 10 weeks from the chart expiration date, charts will display a "NOT FOR NAVIGATION" watermark. The Ownship symbol and flight plan legs are removed from charts that cannot be used for navigation.
8.3 About Geo-Referenced Charts

The greatest additions to situational awareness come from charts that are geo-referenced. A chart is geo-referenced when the chart data supports a correlation of chart position to actual latitude and longitude coordinates. This allows an ownship symbol and flight plan legs to be accurately represented on the chart. If a chart is not geo-referenced, the ownship and flight plan legs cannot be drawn on the chart. Most Jeppesen approach charts and airport diagrams are geo-referenced; most arrival, departure, and miscellaneous charts are not.
8.4 European VFR Charts

European VFR Charts can be included in the CMax subscription from Jeppesen. If loaded, these European VFR Charts can be accessed like standard CMax charts. JSUM version 2.1.5 or later must be used to download European VFR Charts.

Figure 8.1 Chart Selection Page with VFR and IFR charts listed

1) **VFR Charts**—If loaded, VFR charts will be listed first in the list of CMax charts for a given airport.

2) **IFR Charts**—If loaded, standard CMax IFR charts will appear second on the CMax Selection Page below European VFR charts.

If a VFR chart is selected pressing “Display Airport” will display the VFR airport diagram. Likewise, if an IFR chart is selected, pressing “Display Airport” will display the standard Jeppesen airport diagram.
8.5 CMax Chart Page

If CMax is enabled on your EX5000, you can access the CMax Charts page by turning the Select knob to Chart. The Chart page can have two charts ready for viewing at any one time: an airport diagram, and a procedure chart (or another miscellaneous chart associated with that airport). The airport and associated charts are selected on the Chart Selection page, described in Section 8.7, "CMax Selection Page" on page 69.

The Startup page reports the valid dates for the currently loaded chart data. If the date for the next update has passed, the Startup page will report this in yellow cautionary text. If the chart data becomes more than 10 weeks out of date, access to the charts shall be revoked until new chart data is loaded.

On power up, if your EX5000 is receiving a valid position from your GPS unit, the Chart page will default to display the airport diagram of your current position. An approach procedure chart will not be displayed until one is selected. If no valid GPS position is available at start-up, the Chart page will default to the Chart Selection page for manual selection of a chart.

If you select the Chart page immediately upon power up, CMax may still be initializing and will display the following message: "CMax Initializing/Please Wait." The Chart page will begin normal operation when initialization completes.

On landing, if the Chart page is being displayed, the EX5000 will automatically switch to display the Airport diagram for the current location when the GPS Ground Speed drops below 50 knots.

The Chart page shows the airport diagram of the current airport, with ownship symbol for current aircraft position, if the airport diagram is geo-referenced.
1) **Airport Identifier**—The airport identifier for the current airport displays in green.

2) **Chart Name**—The name of the current chart being displayed, also in green.

3) **Geo-referenced Symbol**—When the displayed chart is geo-referenced, a small globe displays. If the chart is not geo-referenced, the globe symbol is crossed out.

4) **Flight Plan Symbol**—an FPL symbol indicates the option to display the current flight plan is turned on. If the display of flight plan is turned off, the FPL symbol is crossed out. Note that if a chart is not geo-referenced or no flight plan is received from the GPS, the flight plan cannot be displayed even if the option is selected.

5) **Select Chart**—Displays the Selection page to allow you to select a new chart for display. For more information, see Section 8.7, "CMax Selection Page" on page 69.
6) **Display**—Display allows you to toggle between displaying Airport and Procedure charts.

- *Display Airport* shows when the current Procedure chart displays. Press *Display Airport* to display the Airport chart.
- *Display Procedure* shows when the current Airport chart displays. Press *Display Procedure* to display the Procedure chart.

7) **View**—Controls which portion of the chart is being displayed. See details below.

8) **Remove Labels**—Removes the button labels from the page to allow a full view of the current chart. Press any button to redisplay the labels.

9) **Emerg. Checklist**—Displays the list of Emergency Checklists. See Section 7.4, "Emergency Checklists" on page 53.

10) **Ownship**—Displays the current position of the aircraft. The chart nominally remains fixed and the ownship symbol moves across the chart with aircraft movement.

11) **Pan Buttons**—The right-hand buttons allow you to manually move the chart on the screen. The pan buttons are only active when the current view can be panned. The Plan view of each chart can generally be panned; many information pages, such as header and departure views, cannot.

   **Not shown: Center**—When you use *Pan*, the *Center* button is displayed to allow you to re-center the chart. When panning, the aircraft position, and ownship symbol, may move towards or off the edges of the chart area. Press *Center* to re-center the chart on the current position hide the *Center* button.

12) **Zoom Control knob**—The right knob allows you to zoom the chart for close-up examination of a specific area. The label only appears when the current view can be zoomed. Most information view pages, such as headers, cannot be zoomed. If you have panned the chart, zooming all the way out to the full-screen chart size also re-centers the chart on the screen.

A typical approach procedure chart is shown in Figure 8.3:
1) **Flight Plan**—The flight plan is overlaid on the Plan View when you select the flight plan display option (on Selection page) and the chart is geo-referenced. If a flight plan does not display, check that you selected the correct airport and approach.

2) **Flight Plan Active Leg**—The active leg of the current flight plan, if displayed, is magenta. Non-active legs are shown in green.

**Note:** The Garmin 430W can use parallel track. If the parallel track is active, the current leg will be displayed in white.

**Note:** The ownship symbol on the Chart page is always oriented according to the current GPS ground track. Therefore, the ownship is always pointed in the direction the aircraft is moving, and does not show any crab angle induced by crosswind components.
The EX5000 provides two sets of charts, Procedure and Airport. For ease of use and readability, each chart is divided into sections that are shown individually. Use the Display button to toggle between Procedure charts and Airport charts. Press View to cycle through the available views for that chart.

Note: For a flight plan to be displayed on a given chart there must be a waypoint on that chart in the flight plan. For example, a direct flight plan from KBED to KLAX passes over KEMT. If you bring up KEMT charts, the KBED-KLAX flight plan will not display. To display the flight plan over KEMT, a waypoint on an approach for KEMT must be included in the flight plan.

Note: If CMax detects non-standard data for a particular chart, a full chart view will be the only available view for that chart, and the geo-referenced ownship and flight plan will not be displayed.

8.6.1 Procedure Chart Views

For the Procedure chart, the Header, Profile, and Minimums views also feature a small “preview pane” of the Plan View, which, although too small to read all chart details, gives the user a general overview of the approach for situational awareness. The flight plan and ownship symbol are also displayed on the preview pane.
The available views are:

### Table 8.1 Airport Procedure Views

<table>
<thead>
<tr>
<th>#</th>
<th>View</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 of 4</td>
<td>Plan</td>
<td>Includes a flight plan overlay if available (shown in Figure 8.3).</td>
</tr>
<tr>
<td>2 of 4</td>
<td>Header</td>
<td>Contains general chart information and appropriate communication frequencies.</td>
</tr>
<tr>
<td>3 of 4</td>

<td>Displays specific departure procedure information.</td>
</tr>
</tbody>
</table>

Figure 8.5 Airport Chart Views
CMax Chart Pages (Optional)

Note that not all charts will have all information sections. Airport charts, for example, may or may not have runway or departure information. For larger airports, this information is often large enough to warrant a separate chart, which can be selected from list on the Selection page.

Charts that cannot be split into smaller sections are shown as a complete chart, with the View button not displayed, since only one View type is available.

Figure 8.6 Airport Departure Chart (Night View)
**8.7 CMax Selection Page**

1) **Chart Selection list**—A list of all charts available for the identified airport. Although the majority of charts listed are indeed instrument approach procedure charts and are generally referred to in this documentation as procedures, the list also includes other types of charts such as airspace diagrams, taxi diagrams, special instructions, and other miscellaneous charts.

**Note:** The EX5000 shows only those charts covered by your Chart data subscription. The Charts are listed in the Jeppesen chart index order.

2) **Chart NOTAMs**—The Chart NOTAMs button only displays if chart NOTAMs exist for the currently-selected airport. Press Chart NOTAMs to bring up a window that lists any associated chart NOTAMs for the airport currently entered in the Airport Entry Field. See Section 8.7.2, "Chart NOTAMs Page" on page 73 for more information.
3) **Day/Night**—Toggles the chart display between *Day* and *Night* modes. Day mode displays black text on a white background; Night mode is white text on a black background. Other colors such as water or shaded terrain are also adjusted for Day or Night mode.

4) **Flight Plan**—Toggles the display of the flight plan overlay on the chart Plan View between DISPLAY and DSPLY OFF. Changes to this selection are effective immediately.

5) **Back to Active**—Returns to the current active chart display screen. Any inputs to the Airport Entry Field or Chart list are abandoned. Changes to flight plan display status, however, are preserved.

6) **Change Airport**—Moves the cursor to the Airport Entry field, described in Section 8.7.1, "Selecting an Airport" on page 71.

7) **Display Chart**—Loads the selected chart and displays it on the Chart page. Remember that the associated Airport diagram is also automatically made available on the Chart page when a procedure chart is loaded by pressing Display Chart.

**Note:** As a valid chart, the Airport diagram is listed in the Chart Selection list, however, it is not usually necessary to load the Airport chart, since it is always accessible on the Chart page by pressing the *Display Airport* button.
8.7.1 Selecting an Airport

Use the Airport Entry Field to specify the airport you want to view.

![Diagram of Airport Selection Page]

1) **Airport Entry Field**—This field accepts airport identification codes (such as KCAD, etc.). The EX5000 will try to auto-complete an airport entry as the first characters are entered. Press the *AutoFill* button to immediately fill this field with the destination airport. Only those airports within the coverage area are auto-completed.

A list of all charts available for the identified airport appears in the chart list area. The name of the airport in the Airport Entry Field is listed next to the entry field.
2) **AutoFill**—When pressed, moves the detected destination airport listed on the button into the Airport Entry Field.

**Note:** The AutoFill button automatically detects the destination airport if the final waypoint is an airport or a waypoint that is part of an instrument approach procedure. However, for some approaches, AutoFill may detect another nearby airport rather than the intended destination. Make sure the desired airport is displayed before pressing the button. AutoFill does not display under the following conditions:

- An Airport cannot be determined due to GPS limitations.
- When the feature is not supported by some GPS models.
- The current airport destination is not available in your chart data coverage area.

3) **Select Chart**—Moves the active selection cursor from the Airport Entry Field to the Chart Selection list.

4) **Next Letter**—Use Next Letter to move the cursor within the Airport Entry Field to the next character location.

5) **Select knob**—Use the right knob to select the character for the current cursor position when entering an airport identifier.
8.7.2 Chart NOTAMs Page

Displays the chart NOTAMs associated with the currently displayed airport.

1) Close—Press Close to close the Chart NOTAMs window and return to the Selection page.

Press the Chart NOTAMs button from the Selection page to display the chart NOTAMs associated with that airport. Chart NOTAMs specific to that airport are listed first, followed by any general chart NOTAMs.

Note: Chart NOTAMs address changes to information contained on the charts, and do not include local or regional operational NOTAMs. Always obtain local and regional NOTAMs before any flight.
In the unlikely event of data corruption during operations, the EX5000 may exhibit one of the following symptoms:

- EX5000 reports that no chart data is available at all.
- Chart page is not accessible.
- Expected airports are not available for chart selection.

If you observe any of these, reload the CMax chart data using the CMax Dataloader, described in the Avidyne Data Update Guide or in the Jeppesen JeppView for MFD Quick Start Guide. If problems persist, contact your dealer or Avidyne Technical Support.

As pilot in command, it is your duty to have backup sources of data available.
The Engine Page displays the health and performance status of the aircraft engine. Most of the engine indications are transmitted to the EX5000 via a remotely mounted Data Acquisition Unit (DAU) or Sensor Interface Unit (SIU) while the remainder are calculated by the Entegra EX5000 or acquired from the Entegra Primary Flight Display (PFD).

The information displayed on your Engine Page depends on:

- Your aircraft type and whether your aircraft is equipped with a DAU or an SIU.

**Note:** If your aircraft is configured with an SIU, certain features may not be supported by the wiring configuration of your aircraft. See your *Pilot Operating Handbook* for more information.

- Whether you have the optional EMax™ Total Engine Management package installed. With EMax installed, the following additional information is available from the Engine Page:
  - Initial Usable Fuel Page to simplify fueling and fuel calculations.
  - Automated Lean Functions.

For more information about EMax, see Section 9.5, “EMax Total Engine Management” on page 88.

**Note:** The Engine Page is unique for each airplane model. Due to differences in aircraft models and features, the images in this chapter may differ slightly from the display in your aircraft. However, the general functions are the same.

**Note:** On startup, you may see three Cirrus-defined Safety Pages before the Engine Page displays. Read these pages carefully to determine your readiness for flight. The Engine Page displays after you read and respond to the Safety pages.
In the event of an engine Data Acquisition Unit (DAU) failure, affected indicators will show a failure as follows:

- Numeric Readouts: Displayed as three white dashes
- Bar Graphs: Disappear
- Needles: Disappear

What to do:

For failure of single indicators, land as soon as practical and consult an Avidyne Authorized Entegra Service Center.

If all indicators fail, check and/or cycle the circuit breaker for the engine DAU. If functionality is not restored, land as soon as practical and have a maintenance facility inspect the system.

9.1 Cirrus Engine Page

![Figure 9.1 Engine Main Page](image-url)
1) **Engine Gauges**—Provides readouts of engine function:
   - **RPM**—Displays current engine speed in revolutions per minute as reported by the DAU.
   - **Manifold Pressure**—Indicates the current engine intake manifold pressure reported by the DAU.
   - **% Power**—Indicates the calculated percent of maximum rated power currently being produced by the engine. For SIU-equipped aircraft, Percent Power is calculated by the EX5000 based on engine RPM, manifold pressure, outside air temperature, and fuel flow. For DAU-equipped aircraft, the % Power is calculated by the PFD and sent to the MFD.
   - **Oil Temperature**—Indicates the current engine oil temperature in degrees Fahrenheit as reported by the DAU.
   - **Oil Pressure**—Indicates engine oil pressure in pounds per square inch (PSI) as reported by the DAU.

2) **Temperatures**—Displays the Turbine Inlet Temperature (TIT) (Turbonormalized engines only), Exhaust Gas Temperature (EGT) and Cylinder Head Temperature (CHT):
   - **Turbine Inlet Temperature (TIT)**—Turbonormalized Engines only—Indicates the turbine inlet temperature in degrees Fahrenheit as a bar graph. The TIT is also displayed as a numeric indication above each bar. An up or down trend arrow will also appear below this numeric indication to indicate whether the TIT is rising or falling.

   Additionally, for turbonormalized engines, if a problem occurs with the primary air intake system, the engine controller may automatically open the alternate induction door. If this occurs, then the ALTN INDUCT DOOR OPEN indicator displays on the Engine Page as long as the door is open. A message also displays in the message bar and on the Aux Main Page.
Exhaust Gas Temperature (EGT)—If the optional EMax engine monitor is installed, indicates the exhaust gas temperature of each cylinder (in degrees Fahrenheit) as a bar graph. The individual EGT of each cylinder is displayed above each bar. An up or down trend arrow appears below the temperature for each cylinder to indicate whether the EGT is rising or falling.

The temperatures are reported by the DAU. You can use them along with the Lean Assist function to lean the aircraft’s engine for desired performance.

If EMax is not installed, only the cylinder with the temperature probe displays.

Cylinder Head Temperature (CHT)—If EMax is installed, indicates the temperature (in degrees F) of each engine cylinder head as reported by the DAU. The individual temperature of each cylinder is also displayed above each bar. A white up or down trend arrow appears above or below the temperature to indicate whether a cylinder’s temperature is rising or falling.

If EMax is not installed, only the CHT for one cylinder displays.

3) **Absolute**—(EMax only). Absolute mode is the default display mode, which indicates the current exhaust gas temperature for each cylinder.

4) **Normalize**—(EMax only). When Normalize is selected, all of the current EGT’s are set to zero. The bar graphs then indicate overall changes in EGT rather than displaying the actual temperature values (as in absolute mode).

5) **Lean Assist**—(EMax only). Allows you to use Lean Assist mode, described in Section 9.3, "Using Lean Assist" on page 84.

6) **Electrical Gauges**—Display information about the state of the electrical system:

   - **M. BUS**—Indicates the voltage of the main bus in volts as reported by the DAU.

   - **E. BUS**—Indicates the voltage of the essential bus in volts as reported by the DAU.
Engine Page

- **ALT. 1**—Indicates the output of Alternator 1 as reported by the DAU.
- **ALT. 2**—Indicates the current output of Alternator 2 as reported by the DAU.
- **BATT**—Indicates the current charge or discharge condition of the aircraft battery in Amps:
  - **Chrg**—Indicates that available electrical power is being used to charge the battery
  - **Dschg**—Indicates that the electrical system is operating at maximum capacity and that battery power is being consumed.

For engines with an SIU, the battery current displays when the alternator is not supplying current. In this case, BATT indicates the battery discharge rate to help shed electrical load.

7) **Fuel Data**—If EMax is installed, the EX5000 displays Fuel Used, Fuel Remaining, Time Remaining, and Fuel Economy in the fuel flow area of the Engines Page. If EMax is not installed, only Fuel Flow displays.

- **FLOW**—Displays the current fuel flow in gallons per hour as reported by the DAU.
- **USED**—Displays the total amount of fuel used since the last engine start as reported by the DAU.
- **REM**—Displays the total amount of fuel remaining in gallons. Remaining Fuel is calculated by the EX5000 based on the starting fuel entered by the pilot on the Initial Usable Fuel Page and fuel flow reported by the DAU.

**Note:** Ensure that both the batteries and the MFD are turned off before refueling. Failure to do so will result in incorrect Fuel Used and Fuel Remaining values for multi-leg flights.

Additionally, if the MFD is restarted in flight, the values for Fuel Used and Fuel Remaining may be reported incorrectly until the next time both the batteries and MFD have been turned off and the fuel level reset.
TIME—Displays the amount of time remaining before the total usable fuel on board will be consumed. Time Remaining is also calculated by the EX5000 based on the setting from the Initial Usable Fuel Page and fuel flow as reported by the DAU. This value is only displayed when the GPS ground speed is greater than 50 knots.

The Time Remaining depends on the current fuel flow, and does not factor in any required reserves. Changes to power settings or winds aloft encountered can drastically alter your range or endurance.

ECON—Displays the current fuel economy in nautical miles per gallon. Fuel economy is based on the fuel flow as reported by the DAU and the groundspeed.

Density Alt—For DAU-equipped aircraft, displays the Density Altitude reported by the Entegra PFD. Density Altitude is pressure altitude corrected for non-standard temperature. Density Altitude affects aircraft performance, especially under high Density Altitude conditions. On the EX5000, Density Altitude is displayed in feet MSL, rounded to the nearest 100 feet. Density Alt does not display on SIU-equipped aircraft.

Outside Air Temperature (OAT)—Indicates the ambient air temperature as reported by the PFD. Press OAT Units to change the display between degrees Fahrenheit and degrees Celsius.

Emerg. Checklist—Displays the list of emergency checklists. For more information, see Section 7.4, "Emergency Checklists" on page 53.

Initial Fuel—(EMax only). Opens the Initial Usable Fuel Page to allow you to indicate the amount of fuel in the tanks. The Initial
Usable Fuel Page is described in Section 9.2, "Initial Usable Fuel Page" on page 83.

It is critical that you accurately enter the actual onboard fuel quantity on the Initial Usable Fuel Page to ensure accuracy of the fuel totalizer functions.

Visually check the actual fuel in each tank in accordance with aircraft POH procedures as part of the aircraft pre-flight inspection. After the amount of fuel has been visually confirmed, enter the amount into the Initial Usable Fuel Page.

Inaccurate fuel entry can result in a misleading indication of fuel or time remaining, which could lead to fuel starvation, loss of engine power, and forced landing.

Be sure to cross-check fuel quantity and fuel remaining during flight.

- **Fuel quantity** is the amount of fuel in the tanks, as measured by the tank probes. See the aircraft POH for any limitations on the fuel measurement.

- **Fuel remaining** is based on a calculation using the initial fuel amount entered by the pilot, and the fuel flow integrated over the time of the flight so far.

**If the Check Fuel Remaining Warning (Red) displays, prepare to land immediately!**
9.2 Initial Usable Fuel Page

If your aircraft is equipped with the optional EMax Total Engine Management package, the Initial Usable Fuel Page displays on startup or when you press the Initial Fuel button. The EX5000 displays the Initial Usable Fuel Page and asks you to input the amount of fuel added to the aircraft.

**Note:** Only use the Initial Usable Fuel Page to enter changes to the known amount of fuel in the aircraft tanks. The Initial Usable Fuel Page is not updated during flight and so cannot be used as an in-flight reference of remaining fuel.

![Initial Usable Fuel Page](image)

**Figure 9.2 Initial Usable Fuel Page**

1) **Fuel Units**—Toggles between US gallons or liters.
2) **Fuel Full**—Press when fuel tanks are filled to capacity.
3) **Fuel to Tabs**—Press when the fuel is filled to the tab indicators in the tanks.

*Fuel Full* and *Fuel to Tabs* allow you to quickly set the amount of fuel to commonly used amounts. In addition, you can use the right knob to fine-tune the amount of fuel added.

4) **Fuel Done**—Press to exit the Initial Usable Fuel Page when the desired amount of fuel has been entered.
9.3 Using Lean Assist

When the optional EMax package is installed, the EX5000 is equipped with a Lean Assist function that allows you to set the optimum mixture for various operating conditions. The EX5000 automatically detects whether you are leaning for best power or best economy and provide visual messages to guide you toward the correct mixture setting.

The Lean State displays in the Engine Data Block on the Map Page, described in Section 9.4.1, "Lean Data Block States" on page 87.

It is very important that you adjust the mixture slowly and continuously. Leaning the mixture too quickly can disrupt the EX5000’s ability to accurately track the peak EGT, and could result in a mixture setting that can damage the engine. Always be sure to monitor Oil Temperature and CHT readings, to ensure they stay within specified limits.

If at any time during the Lean Assist process the engine begins to run roughly, richen the mixture slightly until the roughness abates.

**Note:** See your aircraft POH or Engine Operator’s manual for information on leaning and engine operating limits.

9.3.1 Leaning for Best Power

1) To lean the engine for best power, begin by pressing Lean Assist and smoothly lean the mixture control.

2) The Engine Page displays “Looking for First Peak” at the top of the temperatures section of the display.

3) When leaning for best power, the final mixture setting is based on first cylinder to peak. As the mixture is leaned look for a rise in EGT. In the example shown in Figure 9.3, cylinder #5 is the first to peak, and Peak Detected displays on the Engine Page.

4) At this point you can begin to richen the mixture. As the mixture is richened, the display first annunciates Looking for #5 to Peak (Rich), and then Peak Detected (Rich) as it determines the peak temperature. Finally, Best Power displays when the optimum best power mixture has been achieved.
Using Lean Assist

5) When you are happy with the engine lean setting, exit the Lean Assist function by pressing Normalize or Absolute.

9.3.2 Leaning for Best Economy

1) To lean the engine for best economy, begin by pressing Lean Assist and smoothly lean the mixture control.

2) The EX5000 displays Looking for First Peak at the top of the temperatures section of the display.

3) As the EGT rises the first cylinder will reach peak EGT followed by the second cylinder.

4) Continue to slowly lean the mixture.

5) After the third cylinder peaks, the annunciation will change to Looking for Last Peak. The final mixture setting is based on the last cylinder to peak.

6) As the mixture is leaned further, the last cylinder will eventually peak, and Last Peak Detected will display on the Engine Page.

7) Continue leaning until Best Economy displays, which indicates that the best economy mixture has been achieved.
8) When you are happy with the engine lean setting, exit Lean Assist by pressing *Normalize* or *Absolute*.

![Figure 9.4 Leaning for Best Economy](image-url)
9.4 Data Blocks on Map Page

The Engine Sensor Status Box displays useful engine information on the Map Page. When the Engine Sensor Status Box is available, it displays below the top left data block. The default Engine Sensor Block displays both graphical and text data about percent power, CHT, and EGT, and other data. For information about configuring the data blocks, see Section 10.4, "Data Block Edit Page" on page 95.

For aircraft equipped with turbonormalized engines, the Engine Sensor Status Box also displays the Turbine Inlet Temperature (TIT).

Data blocks in the upper left and right corners of the Map Page can also be configured to show engine instrument information. The available data blocks depend on your aircraft type and configuration. Certain data blocks are available only with the EMax package.

9.4.1 Lean Data Block States

The Lean data block shows Lean mode status. On the Map Page, the Lean data block will show "Economy" or "Power" when you have completed and exited Lean Assist.

Other Lean data block states are:

- **Leaning**—Displayed when you switch back to the map page before exiting Lean Assist mode.
- **Incomplete**—Displays when you exit Lean Assist mode before achieving the desired lean state.
- **FF Change**—Displays when the lean state is changed by a fuel flow adjustment.
- **Pwr Change**—Displays when the lean state is changed by a power adjustment.

For more information about the data blocks, see Table 12.9 Data Block Information on page 125.
9.5 EMax Total Engine Management

The EMax™ Total Engine Management is an optional feature that provides the following information about the health of your engines:

- Initial Usable Fuel Page to simplify fueling and fuel calculations.
- Automated Lean Functions.
- Full CHT and EGT temperature displays on the Engine Page and Map Page data blocks. For information about the engine data on the Map Page, see Table 12.10 Engine Instrument Data Block Information on page 126.
- Real-time recording of time, position, and critical engine performance parameters. EMax records engine and position data for the last 100 hours of flight. The data is recorded every six seconds whenever the MFD is operating.

The output, which you can download via the EX5000's bezel-accessible data port, is in two files:

- An ASCII text file (.txt) containing the engine performance data, can be opened by most spreadsheet programs for analysis.
- A Jeppesen Track file (.log), containing position data that is compatible with Jeppesen FliteStar. For more information about the FliteStar track file, see www.Jeppesen.com.

For information about downloading EMax output data, see Section 12.1.3, "Downloading EMax Data" on page 115.

For information about adding EMax to your EX5000, see your Avidyne dealer.
10 Aux Pages – Configuring the EX5000

The Aux pages allow you to set up and configure a number of options on your EX5000. From the main Aux page, you can view informational messages and select the options you want to configure.

This section discusses the following topics:

- **Aux Main Page**, page 89
- **Airport Filter Setup Page**, page 91
- **Declutter Setup Page**, page 93
- **Data Block Edit Page**, page 95
- **System Time Page**, page 97

10.1 Aux Main Page

![Figure 10.1 Aux Main Page](image-url)
1) **EX5000C Version Information**—Software part number, serial number, and media part number are displayed here. Expiration dates for on-board databases are also shown on this page.

2) **Message List including sensor status**—A record of the messages displayed in the message bar. If more messages are active than space allows, the right knob allows scrolling.

3) **Lightning Strike Test**—Initiates a self-test of the lightning sensor, if installed.

4) **Nav Src**—If your aircraft is equipped with multiple GPS units, switches between GPS1 and GPS2 to provide position information and flight plan data to the moving map.

5) **Emerg. Checklist**—Opens the Emergency Checklist page. For more information, see Section 7.4, “Emergency Checklists” on page 53.

6) **Setup Menus**—Buttons to select specific setup functions including Airport Filter, Declutter Settings, Data Block Editing, and System Time.

   **Scroll knob**—If there are more messages than fit on the current page, **Scroll** allows you to scroll the message list to see the remainder of the messages.

The following buttons display only if a SkyWatch traffic sensor is installed:

- **Traffic Standby**—If a SkyWatch traffic sensor is installed, switches the sensor back into standby mode only while on the ground. To view traffic data while on the ground press **Traffic** in Map page.

- **Traffic Self-Test**—Initiates a 30 second self test of the SkyWatch traffic sensor only while on the ground. This button replaces the **Traffic Standby** button after the Traffic sensor has entered Standby.
10.2 Airport Filter Setup Page

The Airport Filter Setup page allows you to set criteria for nearest airport searches of the database. You can select towered and/or non-towered airports, the type of surfaces you prefer to land on, and the minimum runway length based on your particular aircraft or type of flying. The values selected on this page also dictate the types of airports that get displayed on the map.

1) **Airport Type**—Select Towered, Non-Towered, or both.

2) **Surface**—Select between hard, soft, and/or water surfaces.

3) **Minimum Runway Length**—select the minimum runway length from 2000ft.—7000ft. or show all lengths.

4) **Save**—Saves settings and returns to the Aux Main page.

5) **Cancel**— Cancels any changes and returns to the Aux Main page.

Note: To display airports with both hard surface and water runways check the hard surface box.
6) **Change knob**—The left knob changes the value or status of the selected field.

7) **Select knob**—The right knob moves the blue field selector.
10.3 Declutter Setup Page

The Declutter Setup page is used to define the navigation symbols and other default display settings for the Declutter button. Individual items can be selected for display or a pre-defined group of items can be selected by choosing VFR or IFR defaults.

![Declutter Setup Page](image)

**Figure 10.3 Declutter Setup Page**

1) **IFR & VFR Defaults**—Sets the declutter settings to predefined factory settings based on typical usage.

2) **Display**—Each item has three possible display settings:
   - **On**—The item displays all the time.
   - **Auto**—The item displays automatically and declutters automatically based on pixel density of the display at a given range.
   - **Off**—The item is never displayed.

**Note:** The EX5000 may limit the number of symbols displayed based on the total symbol density.
3) Label—A check in the label box indicates that the item name will be displayed along with the symbol.

4) Range Dots—The circles represent the seventeen available map scales. A cyan-colored circle indicates that the item is displayed at that range. The vertical dash line indicates the map current scale.

**Note:** The 1000NM and 1500NM columns are not displayed because this data is never displayed at these ranges.

5) Save—Saves settings and returns to the Aux Main page.

6) Cancel— Cancels any changes and returns to the Aux Main page.

7) Change knob—The left knob changes the value or status of the selected field.

8) Select knob—The right knob moves the blue field selector.

**Note:** If all display elements are forced on via the Declutter Setup page, the quick declutter setting on Map page is set to maximum, and the Map Range is set greater than 400NM, Map performance may be slow, and in some cases, may cease to operate. If this occurs, you will need to recycle the EX5000 power to restore functionality.

To avoid this situation, Avidyne suggests that you select the IFR or VFR Default declutter setting.
**10.4 Data Block Edit Page**

Data blocks in the upper corners of the Map page can be edited to display information from a list of available data types. The data available depends on your aircraft and EX5000 configuration. A series of dashes represents data that is invalid or unavailable.

![Data Block Edit Page Diagram](image)

**Figure 10.4 Data Block Edit Page**

1) **Factory Defaults**—Resets the Data Blocks to the original display mode.

2) **Left Data Block**—Allows up to 6 lines of data for display and 4 slots for FUEL QTY/TIT/CHT or FUEL QTY/EGT/CHT data blocks. The data block is resized based on number of lines selected. The data block disappears if all lines are blank.

3) **Right Data Block**—Allows up to 6 lines of data for display. The data block is resized based on number of lines selected. The data block disappears if all lines are blank.

   - See Table 12.9 Data Block Information on page 125 for full description of Navigation data available for display in Data Blocks.
See Table 12.10 Engine Instrument Data Block
Information on page 126 for full description of Engine data
available for display in Data Blocks.

4) **Save**—Saves settings and returns to the Aux Main page.
5) **Cancel**—Cancels any changes and returns to Aux Main page.
6) **Change** knob—The left knob changes the value or status of the
   selected field.
7) **Select** knob—The right knob moves the green field selector.
10.5 System Time Page

The System Time page allows you to set the "time zone offset" based on your location relative to UTC. In addition, you can set the amount of time the button labels stay up on the Map page before decluttering or set to never declutter.

![System Time Page](image)

Before conducting flight operations, verify that time and date settings are correct and in GMT (UTC). It is critical that the time be set to the correct GMT to provide accurate display of Datalink weather.

---

1) **Time Source**—Select the time source. If “Auto” is selected, the EX5000 will first try to receive current time data from the attached GPS unit. If the GPS signal is not available, the EX5000 will use the last known time data.

2) **Time and Date Setting**—If manual time source is selected, it allows you to manually adjust the current UTC value.
3) **Time Zone**—Set the time zone for your location, based on an offset from UTC.

**Note:** The EX5000 maintains a constant offset from UTC and does not adjust local time for daylight savings.

4) **Menu Timeout**—Set the amount of time that the menus remain visible on Map page from the following choices (in seconds): 2, 5, 10, 20, 30, 40, 50, 60, Never.

5) **Save**—Saves settings and returns to the Aux Main page.

6) **Cancel**— Cancels any changes and returns to the Aux Main page.

7) **Change knob**—The left knob changes the value or status of the selected field.

8) **Select knob**—The right knob moves the blue field selector.
10.6 MFD CMOS Battery Operation and Replacement

10.6.1 CMOS Battery

A CMOS (Complementary Metal-Oxide Semiconductor) battery is used in the EX5000 Series of MFDs to maintain the system clock. On average, CMOS batteries have been shown to last over 10 years. The clock in the EX5000 Series of MFDs is used to display the current time to the operator and to determine, among other things, the age of datalink products. Additionally, this clock is also used to tag logged data and in calculations such as ETA. Replacement of a CMOS battery is optional. The following section describes the steps that are needed to operate an EX5000 Series MFD with a nonfunctioning CMOS battery.

10.6.2 Operating without a CMOS Battery

This section specifies the recommended steps that should be taken if/when the CMOS battery is no longer capable of maintaining the system time in an EX5000 Series MFD.

Without a CMOS battery, the system will report the current year to be 2000. If this is the case, the system setting should be checked to make sure the "manual" mode of clock update is not enabled. Follow the prescribed steps in the "System Time Page" section of the EX5000 Pilot Guide to set the system to either the "Auto" or "GPS" selection (either selection will update the MFD with the appropriate time). No other actions are required in order to update the system time.

When the system time selection is set to "Auto" or "GPS", the MFD will automatically correct the system time using the incoming GPS data once it is available. All Cirrus, Piper and Lancair OEM configurations, which include the EX5000, are attached to a GPS (GNS430 or IFD440/IFD540) and hence will automatically correct the system time upon battery failure if configured to default to GPS time. Until the GPS time is acquired by the connected GPS, the EX5000 Series of MFDs will display an incorrect time. The connected GPS system typically takes 45 seconds or less to acquire GPS time following system startup. Since the GPS position (and thus time) is available prior to takeoff the time will always be correct prior to takeoff.
10.6.3 CMOS Battery Replacement

For customers whose batteries are no longer operational, and are uncomfortable waiting for a GPS signal in order to facilitate the clock adjustment, we suggest replacement of the CMOS battery. Replacement of a CMOS battery is optional.
11 Datalink (Optional)

Datalink services allow you to view weather and other data on the Map and Trip pages. Avidyne offers Broadcast Datalink services for the EX5000:

For most operations, the EX5000 weather data display is the same regardless of which Broadcast Datalink system is in use.
11.1 Broadcast Datalink

The EX5000 supports an optional Broadcast Datalink receiver, either:

- An ADS-B FIS-B
- An XM receiver that supports XM WX

Both receivers receive a constant stream of weather data. XMD076 Broadcast Datalink requires a fixed monthly subscription.

11.1.1 Using Broadcast Datalink in Flight

The Broadcast Datalink receiver receives weather data continuously. It is not necessary to enable or disable the receipt of individual types of data. You can control the display of received data on the Map, Trip or NRST pages.

Note: The boundary of the available datalink radar data is shown by an area with diagonal stripes. In normal operation, this boundary follows the outline of CONUS if US RDR is selected, or the extent of Canadian Radar if CAN RDR is selected. If, however, datalink radar is unavailable in a particular area for any reason, the hatched lines appear in that area. In the mountains and off the coast, hatched lines may represent no coverage below 10,000 feet. If there are
radar returns in that region above FL100, the returns will be displayed as "islands of precipitation" surrounded by the hatched lines.
11.2 Overview of Datalink Weather

For most operations, the EX5000 displays weather the same way regardless of which Datalink system is used.

Broadcast systems can provide the following:

- **Datalink Radar** - A composite image depicting precipitation as seen by multiple ground-based weather radar sites. The image is color-coded to show both intensity levels and precipitation types. The WX OVLY key on the Map page cycles between on-board radar, 2-Way Datalink RADAR and Datalink RADAR, as available.

![Datalink Radar Color Legend](image)

**Figure 11.2 Datalink Radar Color Legend**

**Note:** Depending on your Broadcast Datalink subscription, Broadcast Datalink can provide lightning strike data, allowing the Map page to add “Datalink” as a source of strike data that is controlled by the Lightning key. The actual weather products delivered depend on your satellite weather subscription plan and your region of the world.

**Warning:** For Datalink RADAR, small areas of high-intensity Datalink Radar data might not be displayed on the EX5000 at high range settings. Instead, larger areas of surrounding lower-intensity returns may obstruct indications of severe precipitation at Map ranges higher than 250 nm. Avoid using Map ranges greater than 250 nm when Datalink Radar echoes are shown in the vicinity of the aircraft.
Overview of Datalink Weather

Before conducting flight operations, be sure to verify that time and date settings on the System Time Setup page are correct and in GMT (UTC). It is critical that the time be set to GMT to provide accurate display of Datalink weather. See Chapter 10 "Aux Pages – Configuring the EX5000" for more information.

- **Text METARs** - The full text of recent surface weather observations. Text METARs appear on the Trip page, and with Broadcast Datalink, they also appear on the following Nearest Airport pages: Nearest to Position and Nearest to Destination.

- **Graphical METARs** - Color-coded flag symbols that summarize a recent surface weather observation. Graphical METARs appear on the Map page, Trip page, and on both types of Nearest Airport pages. They allow a "big-picture" view of general weather conditions in an area. The presence of a graphical METAR does not necessarily mean that the corresponding Text METAR is viewable.

- **AIRMETs and SIGMETs** (US Only) - Areas for which the National Weather Service has issued advisories for various types of hazardous weather. These areas are depicted on the Map page along with an abbreviated description of the hazard, such as "ICE" (icing), "MTN" (mountain obscuration), or "IFR" (instrument flight conditions).

- **TFRs** (US Only) - Temporary Flight Restrictions are areas depicted on the Map page for which the FAA has issued some type of flight restriction. Contact a local Flight Service Station (FSS) for information. The EX5000 does not display any details of the flight restriction.

![Graphical METAR Symbols](image.png)

Figure 11.3 Graphical METAR Symbols
11.3 Symbols Displayed using Datalink

This section describes the symbols displayed using Broadcast Datalink. Figure 11.4, below, displays many of the Broadcast Datalink symbols (though one hopes you are not flying in similar weather). For a complete list of Map symbols, see Chapter 2 “Map Page.”

Figure 11.4 Broadcast Datalink Weather

- **Lightning strike symbols**—Depending on your broadcast service level, lightning information from the broadcast datalink weather is matched to grid coordinates with a resolution of approximately 2 NM. Overlapping lightning symbols may be decluttered for clarity:

- **METAR symbols**—Each METAR reporting station shown on the Map page will have a METAR condition flag displayed. The color of the METAR flag indicates the current conditions at that airport:

- **AIRMETs/SIGMETs**—Depending on your broadcast service level, AIRMETs and SIGMETs are shown as ribbed lines enclosing the area of the advisory and are color coded and
Symbols Displayed using Datalink

labeled as to their type. For more details, see Table 12.7 Airspace and Airways Lines on page 124.

- **Datalink Radar Images**—Datalink Radar images are delivered with a resolution of approximately 1 NM. The EX5000 smooths the edges of the Datalink Radar images, so that the images are not distracting at smaller zoom ranges. The Datalink Radar colors conform to aviation standards: green, yellow, red, and magenta depict varying intensities of rainfall, and shades of blue for snow and pink for mixed precipitation. A handy legend for the Datalink Radar colors is found on the Trip page:

- **Storm Cells**—If storm cells are present, the EX5000 displays the cells along with the cell’s groundspeed, in knots, and direction of travel. If there is a greater than 50% chance of hail, the cell is displayed with a white background. It also shows echo tops.

- **TFR**—Temporary Flight Restrictions (TFRs) are reported over the Broadcast Datalink. TFRs are shown with solid red lines on the Map page. Note that at a full Map Declutter setting (all navigation data and airspace removed), TFRs will also be removed from the display.
11.3.1 Using Datalink without a Traffic Sensor or Radar

Without Radar or a Traffic sensor installed, the EX5000 takes advantage of the available buttons and the WX Reports button is split into two buttons, Air/Sig and Metars, as shown below.

![Figure 11.5 Datalink Weather without Traffic Sensors](image)

1) **Metar**—Controls display of the graphical METAR symbols on the Map page. Press *Metar* to toggle between ON and DSPLY OFF.

2) **Air/Sig**—Controls the display of AIRMETs and SIGMETs. Press *Air/Sig* to cycle between ALL, AIRMET, SIGMET, and DSPLY OFF.
11.4 Nearest Page with Datalink Weather

The Nearest page also displays METAR information received via Datalink. Similarly to the Trip page, the METAR symbols are displayed in a column next to the Nearest airports list, for all airports that have weather reporting stations. Airports that do not report METARs do not have a METAR symbol shown. When Broadcast Datalink is enabled, the text METAR for the currently selected airport is displayed on the lower half of the Nearest page.

For more information about the Nearest page, see Chapter 6, Nearest Page (NRST), beginning on page 45.

Do not rely on the EX5000 as your sole source for TFRs. The status of TFRs may change or may be unavailable. Before conducting a flight, always confirm the state of TFRs with FAA Flight Service.

12.1 Updating Your Databases

Avidyne makes use of three different types of data that can be uploaded to or downloaded from your EX5000:

- **NavData**—For the Map page, Avidyne uses NavData from Jeppesen Sanderson, Inc. It is your duty as pilot in command to ensure that the data you fly with remains up to date.

- **CMax™ Chart Data**—An optional Avidyne feature that allows you to view JeppView chart data on your EX5000.

- **EMax™ Total Engine Management**—EMax tracks engine and other data, which you can download from the EX5000 to your PC for analysis.

You can use a Zip Drive or USB Flash Memory Drive to move data between your PC and the EX5000. For more information about the databases, and about loading data from your PC to a Zip Drive or USB Flash Memory Drive, see the *Avidyne Data Update Guide*.

USB Flash Memory Drives come in many sizes and configurations. A sample USB Flash Memory Drive is shown below. For a list of approved USB Flash Memory Drives, see the Avidyne website at [www.avidyne.com](http://www.avidyne.com).
Reference

This section describes moving data from your Zip Drive or USB Flash Memory Drive to the EX5000.

If using a Zip Drive Dataloader:

- Allowing the portable Zip Drive to dangle by the cable can result in damage to your MFD, or the Drive, as well as a data load failure.
- Do not insert the Zip disk into the Zip Drive until 5 seconds after power-up. The disk may be damaged if it is already in the Zip Drive when power is applied.
- After loading the CMax data into your MFD, wait until the disk is ejected from the drive before unplugging the Drive, or powering off the MFD. Unplugging the Zip Drive with the disk still engaged may cause damage to the disk.

If using a USB Flash Memory:

- Avidyne strongly suggests that, to avoid confusion, you reserve a USB Flash Memory Drive solely for EX5000 database transfers.
- After uploading data, do not remove the USB Flash Memory Drive until you see and acknowledge the regular EX5000 Startup screen.

Note: When removing the rubber cap from the data port, pull the cap gently from the top until it pops out. Make sure the cap is all the way out before plugging anything into the USB port.

Do not tug on the tab at the bottom of the cap; this could separate the cap from the EX5000 bezel.

12.1.1 Loading NavData (the Navigation Database)

Your new EX5000 will be pre-loaded with an up-to-date navigation database. Updates to the EX5000 NavData database are available from Jeppesen Sanderson, Inc. every 28 days and can be purchased either individually or on a subscription basis.
Updating Your Databases

Once you have downloaded the NavData from your PC to either a Zip Disk Dataloader or USB Flash Memory Drive, as described in the Avidyne Data Update Guide, you can upload the data to the EX5000.

To load NavData to your EX5000:

1) Bring either the Zip Drive and disk or the USB Flash Memory Drive to the EX5000 at the aircraft.

2) Turn power OFF to the EX5000.

3) Connect the data source to the EX5000:
   - If using a USB Flash Memory Drive, plug it into the data port on the front of the EX5000.
   - If using a Zip Drive Dataloader, put the Zip disk into the Zip Drive. Connect one end of the cable to the Zip Drive and the other end to the EX5000 data port.

4) Turn on the master switch to power up the EX5000. The Dataloader page is displayed.

5) Press Proceed. Do not turn off the EX5000 or disconnect the cable during a data load. The data load is complete when the regular startup page is displayed.

6) At this point, turn off the power to the EX5000, remove your USB Flash Memory Drive or Zip Drive, and then turn the EX5000 power back on.
   
   This step ensures that all data has been checked in self-test, and the MFD is ready for use.

7) Store the Zip Drive and cable or USB Flash Memory Drive in a safe place.

Note: Ensure that the Dataloader is supported and not dangling by the cable. Letting the Dataloader dangle can cause permanent damage to the data port. It can also cause an intermittent connection, which will result in an unsuccessful data update.

Note: If the regular Startup screen displays, the EX5000 did not detect the Zip Drive. Check the connection between the Zip Drive and the EX5000, then restart the procedure.
12.1.2 Loading CMax Chart Data

For CMax data updates, USB Memory device or ZIP drive and disk capacity must be at least 250 MB. Once you have downloaded the CMax data from your PC to either a Zip Disk Dataloader or USB Flash Memory Drive, as described in the Avidyne Data Update Guide, you will need to upload the data to your EX5000.

To load CMax Data to your EX5000:

1) With the MFD power OFF:
   - If using a USB Flash Memory Drive, plug it into the data port on the front of the EX5000.
   - If using a Zip Drive Dataloader, connect one end of the cable to the Zip Drive and the other end to the EX5000 data port. Do not insert the Zip disk into the Zip Drive until after you turn on the MFD (in step 2).

   **Note:** Ensure that the Dataloader is supported and not dangling by the cable. Letting the Dataloader dangle can cause permanent damage to the data port. It can also cause an intermittent connection, which will result in an unsuccessful data update.

2) Turn on the MFD. If you are using a Zip Drive, insert the Zip disk into the Zip Drive when the initial EX5000 logo screen displays.

3) The Dataloader page displays.
   - If this is the first-ever update, you may see a caution that you are about to load older data than the MFD already contains. This is because the preloaded demo charts expire in the year 2020, so the caution message is normal.
   - Press Proceed to start the chart data load.

4) The Dataloader page shows the progress as it loads the data into the MFD. After loading the data, the Dataloader performs an integrity check on the data and displays a successful data load message if all data is valid.

5) Follow the Dataloader on-screen instructions to disconnect the USB Memory device or Zip disk, and press any key to restart the
MFD. (This built-in restart in the CMax Dataloader makes a power cycle of the MFD unnecessary.)

6) Confirm the valid dates of the Chart data as reported on the Startup screen.

7) Go to the Chart page and select a chart from an airport known to be in your subscription coverage area. Confirm that the chart is available.

8) Store the Zip Drive and cable or USB Flash Memory Drive in a safe place.

12.1.3 Downloading EMax Data

You can download the engine log files from the EX5000 using either a Zip Drive and Zip disk or a USB Flash Memory Drive.

To download the stored engine data log files:

1) Turn power OFF to the EX5000

2) Connect the data source to the EX5000:
   - If using a USB Flash Memory Drive, plug it into the data port on the front of the EX5000.
   - If using a Zip Drive Dataloader, connect one end of the cable to the Zip Drive and the other end to the EX5000 data port.

   **Note:** Ensure that the Dataloader is supported and not dangling by the cable. Letting the Dataloader dangle can cause permanent damage to the data port. It can also cause an intermittent connection, which will result in an unsuccessful data download.

3) Turn on power to the EX5000.

4) If using a Zip Drive, put a compatible blank disk into the Zip Drive when the EX5000 screen displays.

5) The EX5000 will display a message similar to the following:

   *Ready to Write Engine Data to Removable Media.*
6) To begin the download, press Proceed. Do not turn off the EX5000 or disconnect the cable or USB Flash Memory Drive during data transfer.

   To cancel the download, press Cancel.

7) When the data transfer is complete the Start screen opens. If you are using a Zip Drive, the disk is automatically ejected from the Zip Drive.

8) At this point, turn off power to the EX5000, remove your USB Flash Memory Drive or Zip Drive, and then turn the EX5000 power back on. This step ensures that all data has been checked in self-test, and the MFD is ready for use.

9) You can now bring the Zip Drive or USB Flash Memory Drive to your PC and download the EMax data. See the Avidyne Data Update Guide for more information.
12.2 Activating Broadcast Datalink Accounts

If you have a Broadcast Datalink receiver installed, you must log in to MyAvidyne.com or contact XM to activate service for XM WX Satellite Weather. To activate your XM subscription, contact XM Satellite Radio’s Listener Care Center at 1-800-985-9200 and speak with an XM Satellite Radio representative.

For Sirius audio, contact Sirius.

Have the following information available when you contact XM Radio:

- Your name
- The Broadcast Radio Serial Number (ID Number)
  To obtain the ID of the Broadcast receiver installed in your aircraft, open the Trip page. Press the Display key until "Status" (Broadcast Datalink status) is shown, and carefully enter your Radio Serial Number.

**Note:** XM Radio does not use the characters: I (India), O (Oscar), S or F.

- Credit Card Information

**What is Next?**

For XM Broadcast Weather, go to Section 12.2.1, "Activating XM WX Satellite Weather" on page 118.

**Note:** Weather products displayed depend on subscription level.

**Note:** The EX5000’s Service Level indication might take several flights to synchronize to the correct level, but you will still receive and see the weather products you have purchased.
12.2.1 Activating XM WX Satellite Weather

To activate your XM subscription, contact XM Satellite Radio's Listener Care Center at 1-800-985-9200 and speak with an XM Satellite Radio representative.

XM WX Satellite Weather will activate your receiver by sending a unique activation code to your receiver. This code is valid for 24 hours after your call.

To complete and verify the activation:

1) Move your aircraft outside to an area with a clear view of the sky.

2) Power up both the EX5000 and the Broadcast receiver and wait at least an hour to allow the receiver to receive the activation signal.

3) When your receiver receives the activation code from XM, the EX5000 will display information on the following pages:

- **Trip** page - will display METARS, TAFS, Winds Aloft, freezing level forecast, and time since reception for all weather products.

- **Map** page - will display weather, including datalink radar data, satellite-provided lightning, storm cells, and METARs through the use of the METAR symbology

- **Nearest** page - will display METARS through the use of the METAR symbology.

**Note:** If 24 hours pass before you can get to your aircraft, contact XM Satellite Radio's Listener Care Center again or visit [www.xmradio.com/activation](http://www.xmradio.com/activation) to enter your receiver ID number to enable the activation code for your receiver for an additional 24 hours.

**Note:** The EX5000’s Service Level indication may take several flights to synchronize to the correct level but you will still receive and see the weather products you have purchased.

**Note:** Contact Heads Up Technologies for problems relating to your receiver or assistance with service.

  e-mail: service@heads-up.com
  Phone: (972) 980-4890 Ext. 142
12.3 Cleaning the EX5000 Screen

If your EX5000 screen should become dirty due to fingerprints or dust, clean the screen using the following materials and methods:

- A clean, soft lint free cloth such as 3M Ultra-Brite Cloth # 2011 or similar.
- A cleaning solution composed of de-ionized water or isopropyl alcohol (IPA).

Always apply the cleaning solution directly onto the cloth. **Never** spray cleaner directly onto the screen.

**Note:** Use caution when using IPA as it is flammable.

Using any other chemicals or materials voids the warranty.

The EX5000 screen is made of a plastic film that is vulnerable to scratches, damage by sharp articles or improper cleaners. Use care when cleaning.
### 12.4 Sensor Status Block Symbols

**Table 12.1 Sensor Status Block Symbols**

<table>

<td>An animated yellow arrow indicates that Datalink Radar imagery is selected for display, but it is not shown because the Datalink Radar data is invalid. The broadcast signal quality is Good.</td>
</tr>
</tbody>
</table>
12.5 Map Symbols

The EX5000’s Map uses symbols contained in its navigational database, based on your navigational mode and flight situation. Map can display the following database items:

- Airports
- Navaids (VORs, NDBs and Waypoints)
- Airways (Victor and jet)
- Intersections, waypoints and other named fixes
- Class B and Class C controlled airspace
- Tower Zone Airspace
- Obstacles (>200’ AGL)
- Certain classes of special use airspace (Prohibited, Restricted, Warning, Alert and Military Operating Areas)

Navigational symbols used by Map are shown in this section.

Table 12.3 Map Symbols – Airports

<table>
<thead>
<tr>
<th>Airport Type</th>
<th>Surface</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Hard</td>
</tr>
<tr>
<td>Towered</td>

<td>True Airspeed. May not be available depending on aircraft configuration.</td>
<td>From FMS</td>
</tr>
<tr>
<td>UTC TIME</td>
<td>UTC (Greenwich or “Zulu”) time.</td>
<td>0 to 23h 59m 59s</td>
</tr>
<tr>
<td>LOCAL TIME</td>
<td>Local data and time. Derived from UTC time with time zone setting applied.</td>
<td>0 to 23h 59m 59s</td>
</tr>
<tr>
<td>Blank</td>
<td>No data block.</td>
<td></td>
</tr>
</tbody>
</table>
Note: The Baro Altitude may be received from the FMS or GPS (via 429). The FMS/GPS calculates the altitude based on the barometric pressure entered into the FMS by the pilot and pressure altitude received from another source. This display verifies what has been put into the FMS/GPS. Do not rely on this display for terrain separation.

<td>EGPWS Obstacle Warning.</td>
<td>Pull up to avoid terrain.</td>
</tr>
<tr>
<td>TAWS Display Initializing</td>
<td>During its startup phase, this Message displays. While TAWS display is initializing, the TAWS page is painted with magenta dots overlaid by the large text annunciation TAWS DISPLAY INITIALIZING.</td>
<td>The message should clear spontaneously. If the test fails or does not terminate refer to the EGPWS Pilot's Guide.</td>
</tr>
<tr>
<td>TAWS Sensor Self Test</td>
<td>The EGPWS is performing a Self-Test. A distinctive color test pattern will be displayed. The large text annunciation, “TAWS SENSOR SELF-TEST” is presented over the test pattern. The text will remain until the self-test is finished.</td>
<td>If the test fails or does not terminate refer to the EGPWS Pilot's Guide.</td>
</tr>
</tbody>
</table>
When you inhibit EGPWS alerts by means of the separate EGPWS control panel, the TAWS Display page is painted with magenta dots overlaid by the large text annunciation TAWS DISPLAY INHIBITED. Check to see if the control settings are correct. If the EGPWS is not inhibited and if this message persists, contact an Avidyne Authorized Entegra Service Center.

The EGPWS is unable to supply the EX5000 with a reliable TAWS display, probably because one of its inputs from another device in the aircraft is incorrect or unreliable. When the TAWS Display page is unavailable due to this condition, the TAWS Display page is painted with magenta dots overlaid by the large text annunciation TAWS DISPLAY UNAVAILABLE. Check to see that EGPWS is powered up. Have configuration checked at an Avidyne Authorized Entegra Service Center.

Indicates that the EGPWS sensor is powered down or incorrectly attached to the EX5000. Whenever the TAWS Display page is unavailable due to this failure, the TAWS Display page is painted with magenta dots overlaid by the large text annunciation TAWS NOT COMMUNICATING. Check to see that EGPWS is powered up. Have configuration checked at an Avidyne Authorized Entegra Service Center.

12.12 Engine Messages

Note: For messages with yellow and red ranges, if a caution (yellow) message has been acknowledged and removed, transition to the warning (red) range displays a new message. For red warning messages that have been acknowledged and removed, if the value moves back into the yellow range, the EX5000 does not post a new message.

Note: Engine alert messages only display on aircraft that use the Entegra PFD and MFD for primary engine indicators.

13 Using EX5000 Outside the US

When flying outside the United States, some features may either be unavailable or have limited availability. This section describes these differences.

**NOTAM information is subject to constant change. It is extremely important that you check with your local flight service or other official flight advisory service for applicable NOTAMs before EVERY flight.**

### 13.1 Features Available in the US Only

The following features are generally not available on the Entegra EX5000 when flying outside the United States.

- **Obstacle Display**—The obstacle database is valid only for the United States.
- **TIS Traffic**—TIS Traffic is only available in the US where Mode-S radar service is available. For more information about TIS sensors, see Section 1-3-5 of the Aeronautical Information Manual.
- **TFRs**—Temporary Flight Restrictions are displayed only within the United States when 2-Way Datalink is in use.

### 13.2 Features Available in North America

- **XM WX Weather**—XM WX Satellite Weather (Broadcast Datalink), and therefore the EX5000 Datalink features, are not currently available outside North America.

### 13.3 Features Specific to International Flight

- **CMax Chart Data**—Terminal procedure chart availability is determined by your CMax chart subscription coverage. For questions regarding your coverage area, contact Jeppesen at www.jeppesen.com, or by phone (for western hemisphere, including South America, call +1-303-799-9090, for eastern hemisphere, including Europe, call +49 6102 5070).
Using EX5000 Outside the US

- **Terrain Data**—Avidyne provides terrain data for two areas: the Americas, and International (everything else). If you are flying in an area where your current terrain data is not supported, terrain will not display (similar to the Base view on the Map page).

When purchasing an EX5000, you can specify which terrain data you want on your MFD. An International Conversion Utility is available from Avidyne that changes the MFD terrain data between Americas and International. The utility can be installed in the field at an Avidyne Authorized Entegra Service Center. For information about the International Conversion Utility contact Avidyne Technical Support.

Avidyne EXCLUSIVE LIMITED WARRANTY and LIMITATIONS ON LIABILITY

Avidyne warrants the Product manufactured by it against defects in material and workmanship for a period of twenty-four (24) months from delivery. If Avidyne's Product fails to conform to this warranty, Avidyne, in its sole discretion, will either repair or replace the Product or provide a refund of the purchase price paid for the Product. This warranty is made upon the express conditions that:

(a) Avidyne is given prompt written notice of any claimed non-conformity in the Product, with a reasonable explanation thereof;
(b) The Product is returned to Avidyne or to an Avidyne authorized service facility;
(c) The Product has not been altered in any manner other than as previously authorized by Avidyne in writing; and
(d) Repairs to the Product have not been made by anyone other than Avidyne or an Avidyne authorized service facility.

This warranty does not apply to any Product which is not installed, maintained and operated in accordance with Avidyne's written instructions or which is otherwise misused, including, without limitation, to any Product which is damaged due to improper installation, maintenance or operation, tampering, alteration of serial numbers or other manufacturers data, lightning or other electrical source, or otherwise.

If warranty protection is applicable to the Product, Avidyne will use reasonable efforts to repair or replace Product within ten (10) business days of its receipt of the Product.

Any Product that has been repaired by Avidyne or replaced by Avidyne under this warranty will be subject to remainder of the original warranty term applicable to the repaired or replaced Product or will be warranted under the warranty terms above for ninety days from the date of repair or replacement, whichever period is longer.

THIS EXCLUSIVE LIMITED WARRANTY APPLIES IN LIEU OF AND EXPRESSLY SUPERCEDES AND EXCLUDES ALL OTHER REPRESENTATIONS, AFFIRMATIONS AND/OR WARRANTIES, WHETHER EXPRESS OR IMPLIED, ORAL OR WRITTEN, INCLUDING, WITHOUT LIMITATION, ANY WARRANTY OF MERCHANTABILITY, OF FITNESS FOR A PARTICULAR PURPOSE, OF TITLE AND/OR OF NON-INFRINGEMENT. PURCHASER EXPRESSLY AND KNOWINGLY AGREES THAT NO OTHER REPRESENTATIONS, AFFIRMATIONS OR WARRANTIES, WHETHER EXPRESS OR IMPLIED, ORAL OR WRITTEN, FORM PART OF ANY PURCHASE AND SALE TRANSACTION RELATED TO THE PRODUCT.

AVIDYNE'S (AND ITS AFFILIATES') AND ANY PRODUCT COMPONENT SUPPLIER'S SOLE RESPONSIBILITY AND LIABILITY RELATED TO THE PRODUCT OR ARISING OUT OF OR RELATED TO ITS PURCHASE, SALE, PERFORMANCE, RELIABILITY OR USE ARE LIMITED TO ITS REPAIR OR REPLACEMENT, OR TO A REFUND OF THE PURCHASE PRICE, IN AVIDYNE'S SOLE DISCRETION. IN NO EVENT WILL AVIDYNE (OR ITS AFFILIATES) OR ANY SUPPLIERS OF PRODUCT COMPONENTS BE
RESPONSIBLE OR LIABLE FOR ANY OTHER DAMAGE OF ANY NATURE WHATSOEVER, INCLUDING DIRECT, INDIRECT, INCIDENTAL, CONSEQUENTIAL, SPECIAL, LOSS OF USE, LOSS OF REVENUE OR PROFIT, PROPERTY DAMAGE, PERSONAL INJURY, WRONGFUL DEATH, OR OTHER DAMAGE (WHETHER OR NOT AVIDYNE (OR ITS AFFILIATES) WERE NOTIFIED OF THE POSSIBILITY THAT ANY DAMAGE MIGHT BE INCURRED), ARISING OUT OF OR RELATED TO THE PRODUCT, ITS PURCHASE OR SALE, ITS PERFORMANCE OR RELIABILITY, OR THE USE OR INABILITY TO USE THE PRODUCT, FOR ANY REASON, INCLUDING DUE TO ANY PRODUCT DEFECT OR DEFECTS OR ANY ACTION OR INACTION OF ANY NATURE (INCLUDING CLAIMED OR ACTUAL NEGLIGENCE OR GROSS NEGLIGENCE) BY AVIDYNE OR ANY SUPPLIERS OF PRODUCT COMPONENTS. NEITHER THIS EXCLUSIVE LIMITED WARRANTY NOR AVIDYNE'S OR ANY PRODUCT COMPONENT SUPPLIER'S RESPONSIBILITY OR LIABILITY WILL IN ANY WAY BE ENLARGED OR OTHERWISE ALTERED DUE TO AVIDYNE'S PROVISION OF TECHNICAL SUPPORT OR TRAINING RELATED TO THE PRODUCT.

WITHOUT LIMITING THE FOREGOING, NEITHER AVIDYNE (NOR ITS AFFILIATES) MAKE ANY REPRESENTATIONS, AFFIRMATIONS OR WARRANTIES REGARDING OR RELATED TO PRODUCTS NOT MANUFACTURED BY AVIDYNE OR REGARDING OR RELATED TO THE PERFORMANCE OR RELIABILITY OF ANY SUCH PRODUCT, EITHER ALONE OR WHEN USED WITH ANY PRODUCT MANUFACTURED BY AVIDYNE, OR THE SUITABILITY OF ANY SUCH PRODUCT FOR USE WITH ANY PRODUCT MANUFACTURED BY AVIDYNE. AVIDYNE (AND ITS AFFILIATES) EXPRESSLY DISCLAIM ANY AND ALL REPRESENTATIONS, AFFIRMATIONS AND/OR WARRANTIES REGARDING OR RELATED TO ANY SUCH PRODUCTS. IN NO EVENT WILL AVIDYNE (OR ITS AFFILIATES) BE RESPONSIBLE OR LIABLE FOR ANY DAMAGE OF ANY NATURE WHATSOEVER, INCLUDING DIRECT, INDIRECT, INCIDENTAL, CONSEQUENTIAL, SPECIAL, LOSS OF USE, LOSS OF REVENUE OR PROFIT, PROPERTY DAMAGE, PERSONAL INJURY, WRONGFUL DEATH, OR OTHER DAMAGE (WHETHER OR NOT AVIDYNE (OR ITS AFFILIATES) WERE NOTIFIED OF THE POSSIBILITY THAT ANY DAMAGE MIGHT BE INCURRED), ARISING OUT OF OR RELATED TO PRODUCTS NOT MANUFACTURED BY AVIDYNE, THE PURCHASE OR SALE OF SUCH PRODUCTS, THEIR PERFORMANCE OR RELIABILITY, EITHER ALONE OR WHEN USED WITH ANY PRODUCT MANUFACTURED BY AVIDYNE, OR THE SUITABILITY OF ANY SUCH PRODUCT FOR USE WITH ANY PRODUCT MANUFACTURED BY AVIDYNE.

THIS EXCLUSIVE LIMITED WARRANTY ALSO APPLIES IN LIEU OF AND EXPRESSLY SUPERCEDES AND EXCLUDES ALL OTHER RIGHTS ANY PURCHASER HAS OR MAY HAVE RELATED TO THE PRODUCT AND/OR ARISING OUT OF OR RELATED TO ITS PURCHASE, SALE, PERFORMANCE, RELIABILITY OR USE, EITHER ALONE OR WITH ANY OTHER PRODUCT OR PRODUCTS, WHETHER IN CONTRACT, IN TORT (INCLUDING RIGHTS SOUNDING IN NEGLIGENCE, STRICT LIABILITY AND MISREPRESENTATION), UNDER STATUTE, AT LAW, IN EQUITY, OR OTHERWISE, AND PURCHASER EXPRESSLY AND KNOWINGLY WAIVES ALL SUCH RIGHTS TO THE FULLEST EXTENT PERMITTED BY LAW. PURCHASER ALSO EXPRESSLY AND KNOWINGLY AGREES THAT THE PRODUCT IS NOT A CONSUMER GOOD.
THE FOREGOING PARAGRAPHS DEFINE AND LIMIT AVIDYNE’S SOLE RESPONSIBILITY AND LIABILITY AND PURCHASER’S SOLE AND EXCLUSIVE REMEDIES RELATED TO THE PRODUCT.

Some jurisdictions may not allow the exclusion or limitation of warranties or liabilities, in which case the above limitations or exclusions, or some of them, may not apply in those jurisdictions.
Software License

Avidyne Corporation ("Avidyne") is willing to license this software, pilot's guide, and related materials (the "Software") only on the condition that you agree to all the terms of this agreement. Please read these terms carefully.

**Trademarks**

Avidyne and the Avidyne logo are trademarks of Avidyne Corporation. Other brands or products are the trademarks or registered trademarks of their respective holders and should be treated as such.

**License and Certain Restrictions**

You may use the Software on the Entegra EX5000 on which it was delivered. You may not copy the Software for any purpose. You may not transfer the Software or any rights under this Agreement to another party without this Agreement. The other party must agree to accept the terms of this Agreement. The Software contains trade secrets. You may not decompile, reverse engineer, disassemble, or otherwise reduce the Software to human-readable form. You may not modify, adapt, translate, rent, sublicense, assign, lease, loan, resell for proof, distribute, or network the Software, disk or related materials or create derivative works based upon the software or any part thereof. Title, ownership rights, and intellectual property rights in and to the Software belongs to Avidyne and its licensors. The Software is protected by the copyright laws of the United States and by international copyright treaties. Title, ownership rights and intellectual property rights in and to the content accessed through the Software is the property of Avidyne, and where applicable, to the licensor content owners and may be protected by applicable copyright or other law. This Agreement gives you no rights to such content.

Note, the Software includes an internal capability to record certain of the operations and data generated by or provided to the Entegra EX5000, hereinafter referred to as "data files". These data files are an integral part of the Software as they assist Avidyne in testing and assessing the performance of the Software and the Entegra EX5000. You agree in partial consideration for this license that such data files are the property of Avidyne and that you will neither tamper with nor destroy such data files. Further you agree to make such data files (or the Entegra EX5000) available to Avidyne at reasonable times and upon reasonable notice. Avidyne will endeavor to keep the information contained in the data files confidential, except to the extent required by reasonable exercise of its obligations to the FAA or other governmental agency or as a part of a court order. Avidyne makes no commitment to review or share the information contained within the data files with you, and you agree that you have no expectation that this information will be reviewed or shared.
**Government Licensee**

If you are acquiring the Software on behalf of any unit or agency of the United States Government, this provision applies. The Government acknowledges Avidyne's representation that the Software and its documentation were developed at private expense and no part of them is in the public domain. The Government acknowledges Avidyne's representation that the Software is “Restricted Computer Software” as that term is defined in Clause 52.227-19 of the Federal Acquisition Regulations (FAR) and is “Commercial Computer Software” as that term is defined in Subpart 227.401 of the Department of Defense Federal Acquisition Regulation Supplement (DFARS). The Government agrees that: If the Software is supplied to the Department of Defense (DoD), the Software is classified as “Commercial Computer Software” and the Government is acquiring only “restricted rights” in the Software and its documentation as that term is defined in Clause 52.227-7013(c)(1) of the DFARS, and If the Software is supplied to any unit or agency of the United States Government other than DoD, the Government's rights in the Software and its documentation will be as defined in Clause 52.227-19(c)(2) of the FAR.

**Restricted Rights Legend**

Use, duplication, or disclosure by the Government is subject to restrictions as set forth in subparagraph (c)(1)(ii) of the Rights in Technical Data and Computer Software clause at DFARS 52.227-7013, and when applicable subparagraphs (a) through (d) of the Commercial Computer-Restricted rights clause at FAR 52.227-19, and in similar clauses in the NASA FAR Supplement. - Avidyne Corporation, 710 North Drive, Melbourne, Fl. 32934

**Export Law Assurances**

You acknowledge and agree that the Software is subject to restrictions and controls imposed by the United States Export Administration Act and Arms Export Control Act (the “Acts”) and the regulations thereunder. You agree and certify that neither the Software nor any direct product thereof is being or will be acquired, shipped, transferred or exported, directly or indirectly, into any country prohibited by the Acts and the regulations thereunder or will be used for any purpose prohibited by the same.

**Miscellaneous**

This Agreement will be governed by the internal laws of the State of Massachusetts. If any provision of this Agreement is held to be unenforceable, that provision will be removed and the remaining provisions will remain in full force. This Agreement is the complete and exclusive statement of the agreement between us which supersedes any other communications between us in relation to the subject matter of this Agreement. This Software contains dated information. Use of the Software is based on your understanding that this Software may not include all the information or the most current information relevant to your particular situation. If you have any questions concerning this Agreement, you may
contact Avidyne by writing to Avidyne Corporation, 710 North Drive,
Melbourne, Fl. 32934
You acknowledge that, in providing you with the Software, Avidyne and its
licensors rely upon you to read this Agreement, understand it, and agree to
be bound by its terms and not those contained in your purchase order.
If you do not agree to the terms of this license, Avidyne is unwilling to license
the product to you. In such event, you may not use or copy the product, and
you should promptly contact Avidyne for instructions on return of the unused
product(s) for a refund.
